

R02 Soil Metals Screening Depth Graph

6.2.3.2.2 Surface Water / Sediment

Figure 6.2-13 depicts all metals contamination detected in the surface water/sediment pathway at Line 2. Samples RBW-SW/SD-35-01 were collected 10 feet south of Plant Road M bridge in an unnamed tributary which enters Brush Creek near the southeast perimeter of Line 2. Lead and arsenic were detected in the sediment sample. The concentrations may be attributable to relict contamination from surface water runoff from Lines 3, 6, 7, and 9 which also drain to the intermittent stream. No metals of concern were detected in the corresponding surface water sample.

Samples R02-SW-26, R02-SW-27 and R02-SW-28 all reported levels of metals above detection limits, though none of the levels were greater than 2.9 µg/L. Metals were reported in the corresponding sediment samples, though also at low levels, with no levels above 16.0 µg/g.

Lead was reported at 86.3 µg/L in the aqueous sample collected from sump #15, south of Building 2-05-1. Lead was reported in the sediment sample collected from sump #9 (south of Building 2-06-1) at 1290 µg/g and in the sediment sample collected from sump #12 (north of Building 2-05-2) at 631 µg/g.

6.2.3.2.3 Groundwater

Figure 6.2-14 depicts the highest metal concentration reported in the Line 2 wells. Piezometer R02-PZ-35 was installed 150 feet south and downgradient of the sump for Building 2-03. Piezometer R02-PZ-36 was located 60 feet southwest and downgradient of the sump and melt Building 2-05-1. Both piezometers were located in swale areas, topographically downgradient from Building 2-50. Groundwater samples from Piezometers R02-PZ-35 and R02-PZ-36 were collected and analyzed for metals. Piezometer R02-PZ-36 contained chromium at 16.6 µg/L.

Metals of concern were detected in all 6 wells. Chromium was the metal reported with the highest value in all 6 wells. None of the levels exceeded 50.0 µg/L.

6.2.3.3 SVOCs and VOCs

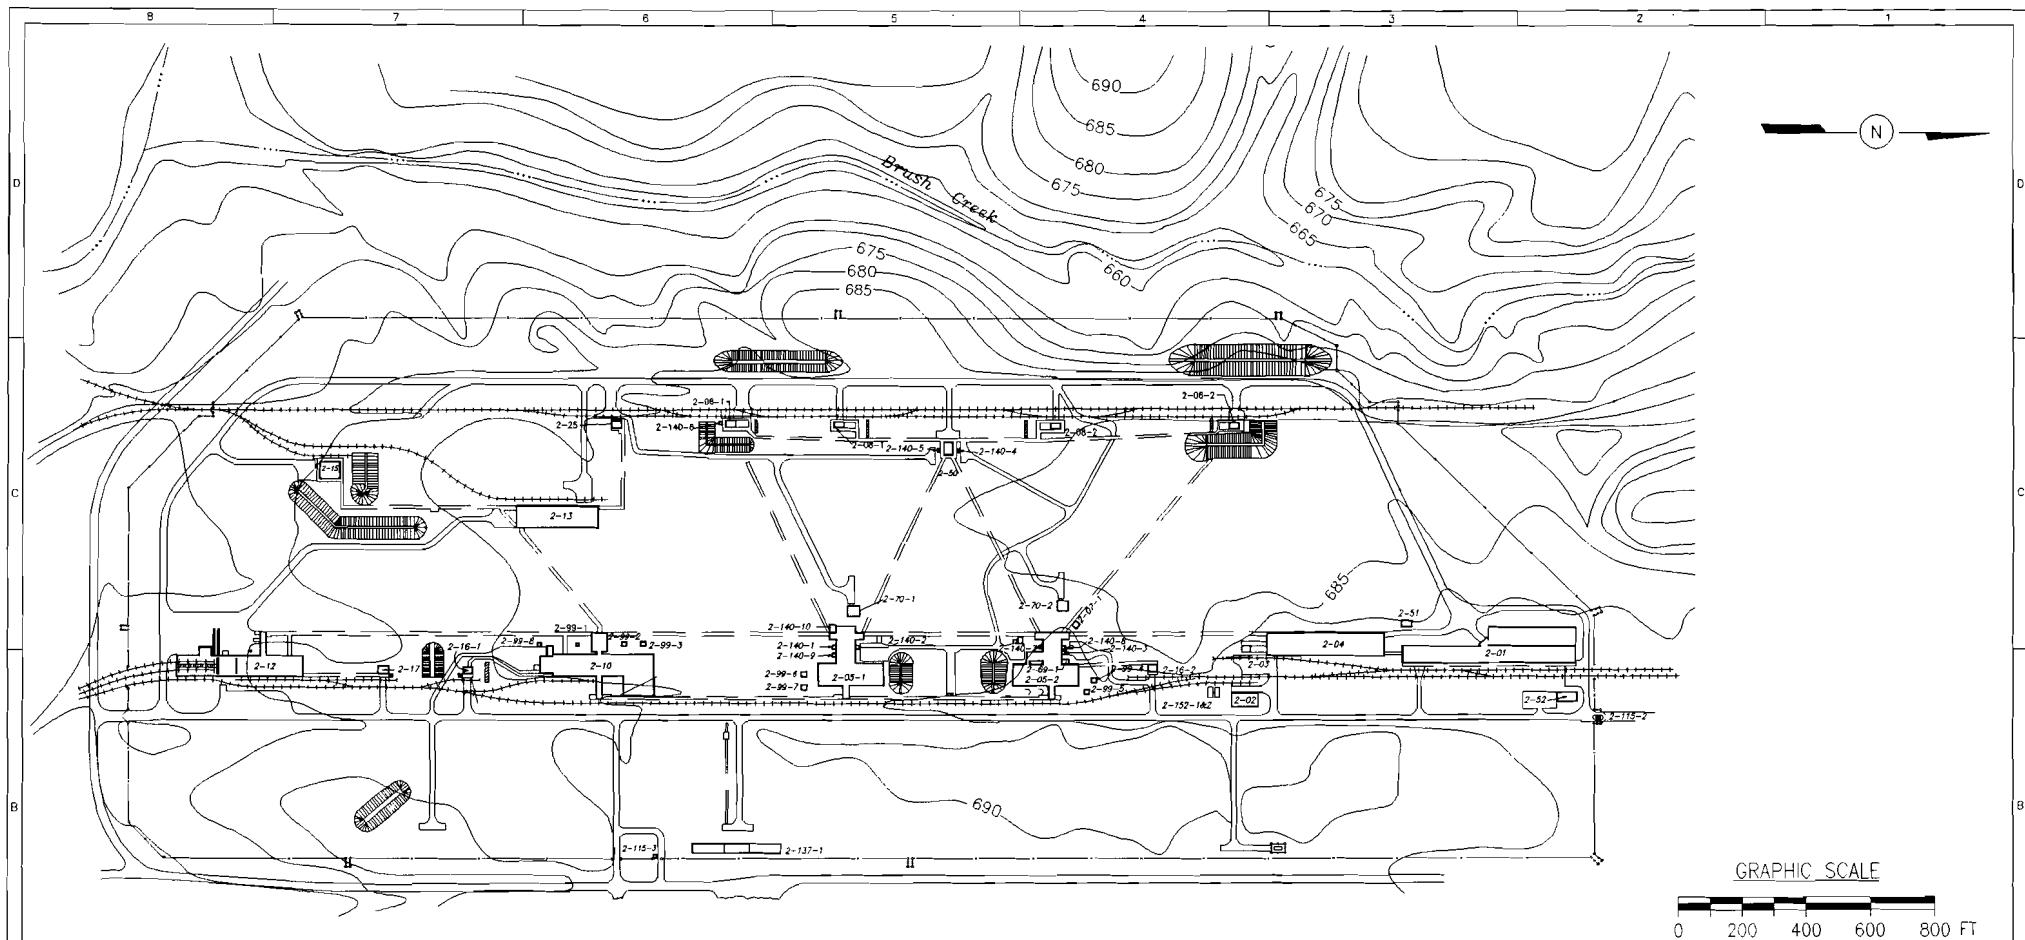

No SVOCs or VOCs were reported in groundwater and surface water samples collected from Line 2 during the RI. Several SVOCs and VOCs were reported in soil samples collected throughout Line 2. With the exception of one sample, none of these levels were above 10 µg/g. (Sample R02-SS-10 reported fluoranthene at 60 µg/g.) SVOCs reported in soil samples include di-n-butyl phthalate, bis(2-ethylhexyl)phthalate, fluoranthene, benzo[def]phenanthrene, chrysene, and phenanthrene. Only 2 samples reported detectable levels of VOCs: carbon disulfide at 0.0065 µg/g and toluene at 0.72 µg/g. See Figure 6.2-11 for locations of SVOC and VOC detects.

Soil gas screening was conducted around 2 areas within Line 2. Building 2-05-2 indicated no concentrations above detection limits, while the survey done at Buildings 2-02 and 2-03 indicated concentrations ranging from non-detect to 1,950 µg/L. Total VOCs were detected in 9 of 34 samples. Buildings 2-02 and 2-03 are Solvent Storage Buildings. Any VOC contamination in this area would be from incidental spills during handling or building clean-up. A waste stream is not generated in these buildings, therefore if any contamination exists it may be in small amounts that is not concentrated to one area (i.e., ditch). It may be difficult to determine the best areas to sample with an inconsistent source as described. Since the soil gas survey suggested that contamination exists, this area will be evaluated during the Groundwater FS. Extraction wells may be installed at this site that will capture contaminants from the area.

6.2.4 Deviations from the Work Plan

Samples R02-SA-32-01, R02-SA-33-01, R02-SA-34-01 were added to the Work Plan during the field event as soil gas confirmation samples.

Two piezometers from which R02-PZ-35-01 and R02-PZ-36-01 were collected, were added to the Work Plan during the field event. These piezometers were installed while attempting to delineate potential contaminated groundwater plumes. These piezometers are discussed in detail in the Soil Gas Survey Report attached as Appendix B.

Table 6.2-2
Sample Summary
Line 2 (R02)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
02-SA-01-01	SI	Explosives, Metals SVOCs, VOCs	C	A	1.5	6' W of Filter House 2-70-2.
02-SD-02-01	SI	Explosives, Metals SVOCs, VOCs	G	A	0.5	60' SW of Filter House 2-70-2 in saturated sediments.
02-SA-03-01	SI	Explosives, Metals SVOCs, VOCs	G	A	0.75	Moved from proposed staked location because of refusal, to location about 5' SSW of the SE corner of the platform E of the unused water tank. S of Building 2-70-1.
02-SA-04-01	SI	Explosives, Metals SVOCs, VOCs	C	A	1.5	SE of Filter House 2-70-1.
02-SS-05-01	SI	Explosives, Metals	C	A	0.5	Three aliquots taken from a 20-foot area adjacent to a support pillar NE of Building 2-08-2.
02-SD-06-01	SI	Explosives, Metals SVOCs, VOCs	G	A	0.5	Drainage ditch sediment located 25' S of an unused wastewater holding tank. (no corresponding SW sample due to lack of water.) SW of Building 2-70-1.
02-SS-07-01	SI	Explosives, Metals	C	A	0.4	Three aliquots taken from a 20-foot area adjacent to a support pillar NE of building 2-08-1.
02-SA-08-01	SI	VOCs, SVOCs	C	A	1.5	Three aliquots at S end of loading dock; vertical depth aliquots of 0-6, 6-12, and 12-18 inches. S of 2-04.
02-SA-08-02	SI	VOCs, SVOCs	C	A	1.5	Duplicate of 02-SA-08-01.
02-EB-09-01	SI	Explosives, Metals SVOCs, VOCs	G	A	N/A	Equipment rinsate blank of auger, bowl an spoon from sample 02-SA-01-01.
R02-SS-01-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	30' W of the SW corner of the Smokeless Powder Service (2-15).
R02-SS-01-02	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Duplicate sample of R02-SS-01-01.

Table 6.2-2 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R02-SS-02-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	15' N and 6' W of SW corner of the Propellant Charge Building 2-13.
R02-SS-03-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	10' W of road and 160' S of driveway, in ditch.
R02-SS-04-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	2' N and 1' W of SW corner of Building 2-06-1.
R2-SS-05-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	18' N of SW corner of the TNT Service Magazine (2-08-1).
R02-SS-06-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	20' N of NW corner of Building 2-08-1.
R02-SS-07-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	235' N of NW corner of Building 2-08-1; in front of the TNT Screening area (2-50).
R02-SS-08-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	E of E wall of Building 2-140-4.
R02-SS-09-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	SW corner of Building 2-06-2.
R02-SS-10-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	6' W of middle point of N face of the Loading Line Storage (2-01).
R02-SS-11-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	15' S of SE corner of Building 2-01, in a drainage ditch.
R02-SS-12-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	N of N face of Building 2-02-2, in a drainage ditch.
R02-SS-13-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	2' S and 2' W of NW corner of Building 2-70-1.
R02-SS-14-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	21' S and 4' E of NE corner of Building 2-70-2.

Table 6.2-2 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R02-SS-15-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	25' W of Building 2-140-7, underneath walkway.
R02-SS-16-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	3' W of NW corner of Melt Building 2-05-2.
R02-SS-17-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	3' W of W face of Melt Building 2-05-1 in stressed vegetation next of stairs.
R02-SS-18-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	12' S of E-W walkway and 4' W of W wall of Building 2-10.
R02-SS-19-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	48' S and 3' E of intersection of brick and metal parts of Buildings 2-82-3 and 2-10.
R02-SS-20-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	2' E of loading dock on E face of Building 2-16-1.
R02-SS-21-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	1' N of NW corner of Building 2-82-2.
R02-SS-22-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	1' E of NE corner of Building 2-12.
R02-SS-23-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	125' N of SE corner of Building 2-12, beneath loading dock door.
R02-SS-24-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	46' S and 18' E of SE corner of Building 2-12.
R02-SS-25-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	5' S of SW corner of western "arm" on W face of Building 2-12.
R02-SD-26-01	I	Explosives, Metals SVOCS, VOCs	G	A	0.5	35' W of walkway 2-82-10.
R02-SW-26-01	I	Explosives, Metals SVOCS, VOCs	G	A	N/A	Corresponds to sample R02-SW-26-01.

SI = Site Investigation
 S = Screening Sample

I = Phase 1 RI/FS
 G = Grab

II = Phase 2 RI/FS

SS = Sump Survey
 C = Composite

FO = Follow-on RI/FS
 NA = Not Applicable

Table 6.2-2 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R02-SW-27-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	335' W of filter house (Building 2-70-2).
R02-SD-27-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to sample R02-SW-27-01.
R02-SW-28-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	In confluence of 3 drainage ditches E of walkway 2-82-19.
R02-SD-28-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to sample R02-SD-28-01.
R02-PZ-29-01	I	Explosives	G	A	18.0	Groundwater sample from R02-PZ-29. Located 150' W of paved road and building 2-08-02 towards perimeter fence and Brush Creek.
R02-PZ-29-02	I	Explosives	G	A	18.0	Duplicate groundwater sample of R02-PZ-29-01.
R02-PZ-30-01	I	Explosives	G	A	20.0	Groundwater sample from R02-PZ-30-01. Located 75' from walkway and building 2-140-4.
R02-PZ-31-01	I	Explosives	G	A	17.0	Groundwater sample from R02-PZ-31. Located 150' E of Building 2-140-4.
R02-SA-32-01	I	SVOCs, VOCs	G	A	4.0	Soil confirmation sample; corresponds to survey site R02-02.
R02-SA-33-01	I	SVOCs, VOCs	G	A	14.0	31' S of Building 2-03; soil confirmation sample; corresponds to survey site R02-29.
R02-SA-34-01	I	SVOCs	G	A	15.0	60' SW of SW corner of Building 2-05-2; soil confirmation sample; corresponds to survey site R02-35.
R02-PZ-35-01	I	SVOCs	G	A	15.0	150' S of Building 2-03; corresponds of survey site R02-35.
R02-PZ-36-01	I	Metals SVOCs, VOCs	G	A	16.0	60' SW of SW corner of Building 2-05-2; corresponds to survey site R02-36.
R02-SS-37-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R02-3005-E-01.
R02-SS-39-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R02-1906-E-01.

6.3 LINE 3 (R03)

6.3.1 Site Background

6.3.1.1 Site Description

6.3.1.1.1 Site Features and Operational History

Line 3 (R03) is located in the central portion of IAAP, west of Brush Creek, southwest of Line 1 and west of Line 2. Line 3 occupies 149 acres and has 56 buildings and covered walkways. Buildings at Line 3 include equipment rooms, explosive magazines, 9 sump buildings, melt buildings, and 2 process water treatment facilities. A site map is provided as Figure 6.3-1.

Line 3 has been in operation as a production line since the IAAP was constructed in 1941, except for a temporary shut down period from 1945 to 1949.

From 1977 until approximately 1985, metal cleaning operations were conducted at Line 3. This process included several stainless steel dip tanks where ammunition casings were immersed in a sulfuric acid/hydrochloric bath, followed by a chromic acid bath, and then rinsed with water. Sludge accumulation in the bottom of the sulfuric acid dip tank was removed, treated with sodium hydroxide, and disposed of in the Line 3A pond. The rinse water was accumulated in the settling tank where it was flocculated with alum to facilitate removal of suspended particulates. The pH of the supernatant was adjusted with lime, and the treated rinse water was discharged under NPDES permit. Sludge from the rinse water settling tank was disposed of in the Blue Sludge Lagoon located at the Inert Disposal Area (R14).

According to previous reports, explosives-contaminated wastewater from Line 3 was transferred to the Former Line 1 Impoundment prior to the installation of the carbon filter treatment systems.

The 2 melt buildings appear to be the areas of highest waste volume production. Wastewater from the melt buildings at Line 3 is treated by settling tanks, filtration, and carbon adsorption at Filter Houses 3-70-1 and 3-70-2. The treated effluent is discharged through ditches to Brush Creek from permitted NPDES outfalls (#032 and #033).

6.3.1.1.2 Topography and Surface Water

Line 3 is located in the dissected till plain section of the Central Lowland Province of the Southern Iowa Drift Plain Region. This area of southeast Iowa experienced continental glaciation. Areas of continental glaciation exhibit broad, flat to gentle undulating terrain. The terrain at the site is dissected by the shallow drainage system of Brush Creek, which originates approximately 4000 feet north of Line 3 and flows in a southerly direction approximately 1500 feet east of the eastern perimeter of the site. Brush Creek continues southerly, draining the central portion of IAAP, to its confluence with Skunk Creek approximately 5 miles south of Line 3.

Portions of Line 3 drain towards an intermittent Brush Creek tributary, which flows in a south/southeasterly direction near the western perimeter of the site. The stream originates near Line 6, flows through portions of Line 9 and Line 7, and continues southeasterly along the western side of Line 3 to its confluence with Brush Creek approximately 2,300 feet southeast of Line 3. Surface water runoff from Line 3 production areas and NPDES discharges drain into an intermittent tributary of Brush Creek which leaves the site at the eastern border and drains into Brush Creek 1500 feet from the eastern perimeter.

The location and topography of Line 3 is depicted on the USGS Burlington Quadrangle Map (Figure 6.3-2). Site features and surface drainage are shown on a reproduction of aerial photographic analysis conducted at Line 3 by EMSL for USEPA Region 7, February 1984 (Appendix D).

6.3.1.1.3 Site Specific Geology

The depth of the loess material at Line 3 is approximately 4 to 6 feet. Underlying the loess is glacial till, characterized as yellowish-brownish and gray mottled clayey silt, associated with the Glasford Formation. The Glasford Formation is represented in southeast Iowa by the Kellersville Till Member. The Kellersville Till is the oldest till of the Illinoian age and overlies the Yarmouth Paleosol. The Kellersville Till is at least 100 feet thick, based on well log data of Phase II RI monitoring wells and IAAP production well number 500-165-3 located 1,000 feet west of Line 3.

6.3.1.1.4 Hydrogeology

A vertical hydraulic conductivity of 2.8×10^{-9} cm/s in the till unit was determined by laboratory analysis of an undisturbed soil sample taken by a shelby tube from monitoring well JAW-77 at 20.0 to 22.0 feet bgs. The shelby tube analysis, grain size distribution, and permeability worksheets are contained in Appendix E.

Soil borings at Line 3 indicate that the percentage of sand increases above a more dense clay-rich perching unit creating a more permeable zone within the lesser permeable till. Due to the presence of sand seam and clay lenses in the glacial layers and dissection by surface drainageways, the localized groundwater flow direction in the unconsolidated material varies across the site often resulting in perched water conditions. At Line 3, shallow groundwater flow in the drift aquifer is generally convergent toward Brush Creek from the eastern terrace and uplands areas.

Six monitoring wells were completed in the drift aquifer ranging from 20.0 to 26.0 feet in depth. The wells were installed between 26 April and 29 April, 1993. One monitoring well is located upgradient of each melt building, and 2 monitoring wells are located downgradient of each melt building. Six piezometers were installed in drainage and swale areas downgradient of suspected contaminant sources. Groundwater and soil samples were obtained from all of the piezometers and monitoring wells.

The depth of the saturated water bearing sand seam ranges from 10 to 18.5 feet in depth with the deeper depths located in the downgradient monitoring wells. The sand zone slopes toward Brush Creek where groundwater is discharged into the creek

system. A fence diagram depicting the lithology of the site is presented as Figure 6.3-3. Geologic profiles are presented in Figure 6.3-4.

6.3.1.2 Previous Investigations

No investigations had been conducted at Line 3 prior to the initiation of the SI.

6.3.2 Site Characterization

A PA performed by JAYCOR in 1991 indicated that there was a potential for contamination at Line 3. A work plan was prepared in June 1991 that detailed an SI which provided for limited sampling to determine whether contamination was present in affected matrices identified in the PA. The SI was initiated in August 1991.

SI sampling of soils, sediments, and surface water concentrated on the buildings historically recognized for storing, generating, or treating process waste and associated drainage pathways. The samples were analyzed for metals, VOCs, SVOCs, and explosives.

One surface water/sediment sample set and 13 soil samples (6 surface soil samples) were collected during the SI at Line 3. Soil samples collected in the northern section of the site were found to contain metals. Explosives were reported in composite Sample 03-SS-11-01, collected from the eastern rail line off-loading area near Buildings 3-06-2 (Ammonium Nitrate Service Magazine) and 3-08-2 (TNT Service Magazine). Explosives were also detected in SI Sample 03-SA-09-01 which was collected from the wastewater sump near Melt Building 3-05-1. Pesticides and metals were reported in SI Sample 03-SS-10-01 south of the X-Ray Bay. Surface Water Sample, 03-SW-07-01, collected from a stream which receives outfall effluent from Melt Building 3-70-2, contained explosive contaminants (HMX, RDX, and tetryl) above SI evaluation criteria.

As a result of SI findings, further investigation was scheduled under the RI for Line 3. The focus of the RI sampling effort was to determine the extent of metals and explosives contamination identified in the SI.

A phased approach to the RI field effort was utilized to refine project objectives as more data about each site was acquired. The Phase I field effort focused on surface and shallow subsurface soil sampling. Phase I included the following tasks: soil gas investigation; piezometer installation; XRF screening for metals in soil; field sampling and on-site analysis of soil samples for explosives; and soil and surface water/sediment sampling. Phase I commenced 5 July 1992 and was completed 23 November 1992. An intermediate study consisting of groundwater sampling from piezometers installed during Phase I was conducted to optimize permanent monitoring well locations proposed for Phase II. The piezometer sampling was conducted 12 through 19 December 1992.

Concurrent with Phase I, an independent sump survey was performed by JAYCOR on three sumps within Line 3. The results are discussed in detail in the following sections along with RI data.

The Phase II field effort focused on at-depth soil sampling and monitoring well installation and sampling. Phase II commenced 12 April 1993, following a site reconnaissance with drilling subcontractors 5 through 8 April 1993.

In October 1994, JAYCOR performed an independent melt basement sampling of Building 3-05-2. One surface water and 4 sediment samples were collected. The results are discussed in coordination with the RI data in the following sections.

A Draft RI report was submitted to EPA, Region VII. After review of the report a Follow-on Sampling effort was recommended. The Follow-on Sampling at Line 3 consisted of further delineation of soil contamination around several previously unsampled sumps, determining if VOCs were present in the groundwater, collection of 2 additional surface water/sediment sets, and confirming soil gas results. Follow-on sampling commenced 3 April 1995.

The sampling and analysis for all phases, as well as the 2 independent surveys, were conducted in accordance with the protocols presented in Appendix G of the QAPP submitted as Volume 3 of the Phase I RI work plan. The Soil Gas Investigation Report is included as Appendix B of this report.

The following sections detail the results of the RI activities. All samples collected at this site in association with the JAYCOR study are summarized in Table 6.3-1, following Section 6.3.4. Refer to the Line 3 Soils Map (Figure 6.3-5), the Line 3 Screening Maps (Figures 6.3-6a through -6l), and the Line 3 Groundwater and Surface Water/Sediment Map (Figure 6.3-7) for all sample locations. Table 6.3-2 depicts all contaminants of concern above detection limits. All fixed laboratory results may be found in Appendix F; all screening results may be found in Appendix G.

6.3.2.1 Soils and Vadose Zone Sources and Contaminants of Concern

Twenty-two fixed laboratory soil samples were collected from the 0 to 0.5 foot bgs interval at Line 3 during Phase I and analyzed for VOCs, SVOCs, explosives, and metals by a fixed laboratory. The samples are labeled R03-SS-01 through -22.

Metals and explosives screening were conducted around the fixed laboratory sample locations and around several other buildings: 902 soil samples (672 for metals and 230 for explosives analysis) were collected within the Line 3 boundary. Twenty-five of the explosives screening samples and 61 of the metals screening samples were sent to a fixed laboratory for confirmatory, analytical analysis.

An independent study of 36 sumps was conducted by JAYCOR concurrently with the RI. Surface soil and at-depth soil samples were collected around 3 sumps at Building 3-05-1. The soils exhibiting the most significant contamination were those surrounding the sumps. Further sampling at-depth evidenced similar results as the field screening

program. Sample contaminant levels were significantly lower in the at-depth samples than in the corresponding surface samples. A report detailing all findings was submitted to USAEC under separate cover on 9 June 1993 and entitled "Contamination Assessment of Concrete Sumps at Iowa Army Ammunition Plant."

Below are the locations of the fixed laboratory and screening samples in association with the appropriate building. Refer to the R03 Soils Map and R03 Screening Maps for fixed laboratory, confirmatory, and screening sample locations.

Building 3-12

Samples R03-SS-01-01 and R03-SS-02-01 were collected around the assembly and shipping Building, 3-12. Twelve samples were collected and screened for explosives and 84 samples were collected for metals from soils west and east of Building 3-12 (nodes 500, 600, and 700). See Figure 6.3-6a.

Building 3-17

Sample R03-SS-03-01, was collected east of Building 3-17 (fuse service magazine). Two samples were collected and screened for explosives and 19 samples were collected and screened for metals west of Building 3-17 (node 4300). See Figure 6.3-6b. Sampling focused on the loading areas, doorways, and railroad tracks.

Building 3-16-1

Sample R03-SS-04-01 was collected approximately 50 feet northwest of the booster service magazine, 3-16-1. Two samples were collected and screened for explosives and 18 samples were collected and screened for metals in soils north and west of the building (node 4200). See Figure 6.3-6b.

Building 3-10

Sample R03-SS-05-01 was collected north of Building 3-10 X-Ray Bay. Samples R03-SS-06-01 and R03-SS-07-01 were collected around drilling and boosting Building 3-10. Sixteen samples were collected and screened for explosives and 75 samples were collected and screened for metals around Building 3-10 (nodes 800, 900, 1000, 1100, and 3800). See Figure 6.3-6c.

Building 3-05-1

This building consists of 3 floors with a combined area of 19,960 square feet. Access to the basement is through an outside-entrance crawlspace measuring about 2 feet square. The construction of the basement is concrete footer over dirt floors. A wooden catwalk is suspended approximately 8-10 feet above the floor. According to Mr. Hicks, the asbestos insulation overwrapping steamlines is deteriorating and friable asbestos is exposed. This melt/pour building is active.

Samples R03-SS-08-01 and R03-SS-09-01 were collected around Building 3-05-1. Sample R03-SS-08-01 was collected approximately 45 feet southeast of Building 3-05-1. Sixty-eight samples were collected for explosives screening analysis and 92 samples were collected for metals screening analysis around Building 3-05-1 (nodes 1200, 1300, 3200, 3300, 3400, 3500, 3600, and 3700). See Figure 6.3-6d.

The 3 sumps that are located at Building 3-05-1 were sampled during the independent sump survey. Building 3-140-6 was identified as sump 19, the sump located approximately 50 feet north of Building 3-05-1 was identified as sump 17, and the sump located adjacent and north of Building 3-05-1 was identified as sump 18. Two surface and 2 collocated at depth (2.6 feet bgs) samples were collected at the northeast and southwest corners of sump 17. Two surface and 2 collocated at depth (2.8 feet bgs) samples were collected beneath the outfall pipe and on the west side of sump 18. Two surface and 2 collocated at depth (3.1 feet bgs) samples were collected on the east and west sides of sump 19. One surface and 1 collocated at depth (1.0 foot bgs) sample were also obtained from the depressional area east of the sump.

Building 3-05-2

This Building consists of 3 floors with a combined area of 27,012 square feet. Access to the basement is through an outside-entrance crawlspace measuring about 2 feet square. The construction of the basement is concrete footer over dirt floors. A wooden catwalk is suspended approximately 8-10 feet above the floor. According to Mr. Hicks (IAAP Health and Safety), the asbestos insulation overwrapping steamlines is deteriorating and friable asbestos is exposed. This melt/pour was inactive for some time, but was brought on line in December 1992 and is now active.

Samples R03-SS-10-01 and R03-SS-11-01 were collected around Building 3-05-2. Sixty-eight samples were collected and screened for explosives and 128 samples were collected and screened for metals around this building (nodes 200, 1400, 1500, 2700, 2800, 2900, 3000, and 3100). See Figure 6.3-6i.

An independent melt basement sampling event was conducted by JAYCOR for Mason and Hanger during the fall of 1994. Five sediment samples and 1 surface water sample were collected from the basement of Building 3-05-2. All samples, with the exception of the surface water sample, were split by an EPA Region VII representative. All samples were analyzed for VOCs, SVOCs, metals, and explosives.

During the Follow-on sampling, 3 surface and 3 collocated 3.0 feet bgs samples (R03-SS-607 through R03-SS-609) were collected west, north and east of Building 3-140-5, which is located north of Building 3-05-2.

Building 3-16-2

Sample R03-SS-12-01 was collected northeast of booster service magazine, 3-16-2. Seven samples were collected for explosives screening analysis and 21 samples were collected for metals screening analysis around Building 3-16-2 (node 1700). See Figure 6.3-6k.

Building 3-04

Sample R03-SS-14-01 was collected west of Receiving and Painting Building 3-04. Sample R03-SS-13-01 was collected east of Solvent Storage Building 3-03 and south of Building 3-04. Four samples were collected and screened for explosives and 26 samples were screened for metals in soils west of Building 3-04 (node 1800). See Figure 6.3-6k.

Building 3-01

Ten samples were collected and screened for explosives and 73 samples were collected and screened for metals around Building 3-01 and its associated drainage areas (nodes 300, 1900, 2000, and 2100). See Figure 6.3-6l.

Building 3-06-2

Samples R03-SS-15-01 and R03-SS-16-01 were collected around ammonium nitrate service magazine 3-06-2. Fourteen samples were collected for explosives screening analysis and 34 samples were collected for metals screening analysis around Building 3-06-2 (node 400). See Figure 6.3-6j.

Building 3-08-2

Samples R03-SS-17-01 and R03-SS-18-01 were collected around TNT service magazine 3-08-2. Four samples were collected and screened for explosives and 19 samples were screened for metals in soils east of Building 3-08-2 (node 2200). See Figure 6.3-6h.

Building 3-50 and Associated Buildings 3-140-2 and 3-140-3

Sample R03-SS-19-01 was collected southeast of TNT Screening Building, 3-50. Four samples were collected and screened for explosives and 26 samples were collected and screened for metals around the building (nodes 3900, 4000, and 4100). See Figure 6.3-6g.

During the Follow-on sampling, 6 soil samples (R03-SS-601 through R03-SS-603), 3 surface and 3 collocated at-depth, were collected around Building 3-140-2.

During the Follow-on sampling, 6 soil samples (3 surface and 3 collocated at-depth) were to be collected around Building 3-140-3. However, this sump had been removed during the COE Sump Removal and these samples were not collected.

Building 3-08-1

Sample R03-SS-20-01 was collected southwest of TNT service magazine, 3-08-1. Four samples were collected for explosives screening analysis and 28 samples were collected for metals screening analysis around this building (node 2400). See Figure 6.3-6f for screening sample locations.

Building 3-06-1

Samples R03-SS-21-01 and R03-SS-22-01 were collected around ammonium nitrate service magazine, 3-06-1. Sample R03-SS-21-01 was collected around the southwest corner of the building. Sample R03-SS-22-01 was collected 50 feet southeast of the building. See Figure 6.3-5. Fifteen samples were collected and screened for explosives and 18 samples were screened for metals in soils around Building 3-06-1 (node 2600). See Figure 6.3-6e.

At-Depth Soil Sampling

Soil samples were collected at 3 to 3.5 feet bgs during piezometer emplacement. Continuous undisturbed soil samples were collected from the soil borings during monitoring well installation. The soil samples were logged lithologically and a

representative portion was placed in a resealable bag. Six soils samples were submitted for analysis ranging in depth from 11.3 to 18 feet bgs.

Soil Gas Survey

Soil gas screening of the vadose zone was conducted around the Line 3 storage Building 3-03. The soil gas survey examined 21 sampling locations at depths ranging from 5 to 15 feet. Seven of the 21 sample locations were reported to have detectable levels of Total VOCs. The concentration ranged from below detection limit to 1,462 $\mu\text{g}/\text{L}$ at 1 sample location.

During the Follow-on sampling, 2 samples were collected and analyzed for VOCs to confirm earlier soil gas results. Sample R03-SA-610 was collected at 5.0 feet bgs at former soil gas survey point R03-1 (between Building 3-03 and the railroad tracks), where 1462 ppb TVOCs were reported. Sample R03-SA-611 was collected at 5.0 feet bgs at former soil gas survey point R03-13 where not TVOCs were reported.

6.3.2.2 Surface Water/Sediment Sources and Contaminants of Concern

Four surface water/sediment samples were collected during Phase I in association with Line 3 and analyzed for VOCs, SVOCs, explosives, and metals parameters.

Phase I surface water/sediment samples were collected from drainage channels originating from an NPDES outfall at Building 3-05-2. Samples R03-SW/SD-35 were collected closest to the outfall and Samples R03-SW/SD-36, R03-SW/SD-37, and R03-SW/SD-46 were collected downstream.

Five basewide surface water and 6 sediment samples were obtained from 2 unnamed intermittent streams which drain portions of Line 3. The basewide samples were analyzed for metals, explosives, VOCs, and SVOCs; their locations are discussed below.

Sample RBW-SD-52 (no surface water available) was collected from the Brush Creek intermittent tributary east of Line 9 and approximately 1,500 feet west of Line 3. This sample indicates upstream sediment conditions for the tributary, prior to draining the southern portion of Line 3. Samples RBW-SW/SD-42 were collected from the Brush Creek tributary near the southern corner of Line 3. Samples RBW-SW/SD-39-01 were collected from a drainageway directly south of the site which empties into the intermittent stream. Samples RBW-SW/SD-35-01 were collected from the intermittent stream 500 feet before its confluence with Brush Creek, 10 feet south of the Plant Road M bridge and 2,500 feet southeast of Line 3.

Samples RBW-SW/SD-41-01 were collected in a drainage channel, downgradient of NPDES outfall #033.

Samples RBW-SW/SD-38-01 were collected from a drainage channel, downgradient of NPDES outfall #032.

Four additional surface water/sediment sets were collected during Phase II (R03-SW/SD-506, R03-SW/SD-507, R03-SW/SD-508, R03-SW/SD-509). The samples were obtained from drainageways south and west of Line 3.

During the Follow-on sampling, 2 additional surface water/sediment sets (R03-SW/SD-601 and R03-SW/SD-602) were collected in drainage patterns east of the line where the drainage exits the line. All 4 samples were analyzed for metals and explosives. Samples R03-SW/SD-601 were collected along the east fenceline of Line 3, where the flow that originates south of 3-08-1 exits the line. Samples R03-SW/SD-602 were collected along the east fenceline of Line 3 where the flow that originates north of Building 3-08-1 exits the line.

IAAP is permitted by the State of Iowa (permit #29-00-9-00) to discharge a monthly average of 500 $\mu\text{g}/\text{L}$ of TNT with a daily maximum of 1,000 $\mu\text{g}/\text{L}$, and a monthly average of 2,000 $\mu\text{g}/\text{L}$ of RDX+HMX with a daily maximum of 5,000 $\mu\text{g}/\text{L}$.

The drainage channels from which Line 3 surface water and sediment samples and basewide Samples RBW-SW/SD-38-01 and RBW-SW/SD-41-01 were collected converge within Line 3 and drain off-site at the eastern border of the site as an unnamed intermittent tributary. This tributary meets with Brush Creek approximately 1500 feet east of Line 3.

6.3.2.3.3 Groundwater Sources and Contaminants of Concern

During Phase I, a soil gas investigation was conducted and 6 piezometers were installed and sampled to optimize permanent monitoring well locations. Results from the soil gas investigation are included as Appendix B. The 6 groundwater samples collected from the piezometers were analyzed for explosives.

Six monitoring wells were installed during Phase II to further characterize subsurface conditions upgradient and downgradient of the melt buildings at Line 3. Two wells were located upgradient (JAW-57 and JAW-77) and 4 wells (JAW-54, JAW-55, JAW-56, and JAW-53) were located downgradient of the buildings. All wells were installed at a depth of 20 to 25 feet bgs. The monitoring wells were sampled, and groundwater was analyzed for metals and explosives.

During the Follow-on sampling, wells JAW-53, JAW-55, and JAW-56 were sampled for VOCs to determine if VOCs were a concern in the groundwater, per EPA Region VII request.

6.3.3. Nature and Extent of Contamination

Below is a discussion of the nature and extent of analytes found at Line 3 during the SI and RI. Figures 6.3-8, 6.3-9a through -9l, 6.3-10, and 6.3-11 depict contaminants of concern and their appropriate contamination ranges for the fixed laboratory soil

samples, screening samples, surface water and sediment sample, and groundwater samples at Line 3.

6.3.3.1 Explosives

One hundred and eleven soil samples were analyzed by the fixed laboratory for explosives from Line 3. 2,4,6-TNT was detected in 54 samples at levels up to 100,000 $\mu\text{g/g}$; RDX was detected in 45 samples at levels up to 2400 $\mu\text{g/g}$; HMX was detected in 33 samples at levels up to 610 $\mu\text{g/g}$; 1,3,5-TNB was detected in 27 samples at levels up to 23,000 $\mu\text{g/g}$; 2,4-DNT was detected in 12 samples at levels up to 210 $\mu\text{g/g}$; 1,3-DNB was detected in 5 samples at levels up to 25 $\mu\text{g/g}$; nitrobenzene was detected in 2 samples at levels up to 120 $\mu\text{g/g}$; and 2,6-DNT was detected in 1 sample at 26 $\mu\text{g/g}$.

A total of 25 aqueous samples was collected from Line 3 and analyzed for explosives. RDX was detected in 9 samples at levels up to 5400 $\mu\text{g/L}$; HMX was detected in 7 samples at levels up to 740 $\mu\text{g/L}$; 1,3,5-TNB, 2,4,6-TNT, and 2,4-DNT were each detected in 2 samples at levels up to 880, 8000, and 81 $\mu\text{g/L}$, respectively; and nitrobenzene and tetryl were each detected in 1 sample at 20.6 and 25 $\mu\text{g/L}$, respectively.

6.3.3.1.1 Soils

The highest levels of explosives are located at both melt buildings (3-05-1 and -2). See Figure 6.3.8 for fixed laboratory explosives contamination; see Figures 6.3-9a through -9l for screening contamination. Elevated explosive results are also associated with Buildings 3-10 (drilling and boosting) and 3-06-1 and 3-06-2 (TNT service magazines) to a lesser degree. 2,4,6-TNT is the explosive in the greatest quantity, RDX is present in a lesser amount, and HMX and tetryl exist in minor quantities probably as impurities of the RDX used at the line.

Building 3-05-2

Building 3-05-2 had the largest number of samples resulting in the highest levels of explosives. There were 22 sample locations collected during the various phases of the investigation in the vicinity of Building 3-05-2 and its associated bag house and analyzed by the fixed laboratory. Of the 22 sample locations, explosives were detected in 13. Seven locations contained explosive results above 1000 $\mu\text{g/g}$. One location reported results between 100 and 500 $\mu\text{g/g}$, 2 locations reported results between 10 and 100 $\mu\text{g/g}$, and 3 locations resulted in explosive results less than 10 $\mu\text{g/g}$. All 13 sample locations are located on the east side of the building near sumps and doorways. Explosives were detected in 31 screening sample locations (out of 68 total) from 16 locations (nodes 200, 1400, 1500, 2700, 2800, 2900, 3000, and 3100). See Figure 6.3-9i. These samples are clustered northeast of Building 3-40-1, west of Building 3-140-4, and south of Building 3-70-2. Six of these sample locations did not contain explosives in collocated samples collected at-depth.

Building 3-05-1

Building 3-05-1 had 15 sample locations collected during the different phases of the RI at Line 3 and analyzed by the fixed laboratory for explosives. Of the 15 sample locations, 11 contained explosives. Two sample locations resulted in explosive levels above 1000 $\mu\text{g/g}$, 1 sample location resulted in explosive levels between 500 and 1000

$\mu\text{g/g}$, and 2 sample locations reported explosives results between 100 and 500 $\mu\text{g/g}$. Four sample locations reported explosive results between 10 and 100 $\mu\text{g/g}$ and 2 sample locations reported explosive results below 10 $\mu\text{g/g}$. Ten of the 11 sample locations were on the east side of the building around sumps and doorways. The remaining sample location was on the west side of the building between the train track and the building. Twenty-five screening samples from 13 locations contained explosives results above detection limits (nodes 1200, 1300, 3200, 3300, 3400, 3500, 3600, and 3700). These samples are clustered east of Carbon Filter Building 3-70-1, southeast of Building 3-140-6, south of Building 3-05-1, and southeast of Building 3-99-3. Seven of the 13 locations had collocated at-depth samples that did not contain explosives. Perimeter samples did not contain explosives. See Figure 6.3-6d for screening sample locations and Figure 6.3-9d for screening contaminant locations.

Building 3-10

Six samples locations were collected around Building 3-10 and analyzed for explosives by the fixed laboratory. Four locations reported levels of explosives above detection limits. One location sample contained explosives between 100 and 500 $\mu\text{g/g}$, 1 sample location contained explosives levels between 10 - 100 $\mu\text{g/g}$, and 2 sample locations contained explosives levels less than 10 $\mu\text{g/g}$. Four (3 surface and 1 at-depth) of the 16 samples collected for explosives screening analysis (nodes 800, 900, 1000, 1100, 3800) contained explosives: R03-901E-01, R03-1001E-01, R03-1002E-01, and R03-1002E-02. No collocated 1.0 feet bgs sample was collected below R03-901E-01. The collocated samples collected at 1.0 foot bgs and 2.0 feet bgs at sample locations R03-1001E and R03-1002E, respectively, did not contain explosives. See Figure 6.3-6c for screening sample locations and Figure 6.3-9c for contaminant locations.

Buildings 3-06-1 and 3-06-2

Three fixed laboratory samples were collected around each 3-06 building. One sample at each building resulted in explosives results above 1000 $\mu\text{g/g}$. Each sample was located on the east side of the buildings between the train track and loading dock. Five screening samples in 2 locations (R03-401E and R03-405E) contained explosives concentrations at Building 3-06-2. See Figure 6.3-9j. Both R03-401E and R03-405E are located between the loading dock and the railroad tracks. At Building 3-06-1, 1 sample location, R03-2601E collected at the loading dock (see Figure 6.3-6e), contained explosives to a depth of 2.0 feet bgs. No collocated 3.0 feet bgs sample was collected. Perimeter samples did not contain explosives. See Figure 6.3-9e for screening sample contaminant locations.

Building 3-12

At Building 3-12, explosives were not detected in either of the 2 samples analyzed for explosives at the fixed laboratory. Only 1 of 12 screening samples, R03-601E-02 collected at a depth of 1.0 foot bgs southeast of the building, reported a detectable level of explosives. There was no collocated 2.0 feet bgs sample collected. This sample location is at the southwest corner of the building at a loading dock. See Figure 6.3-6a for screening locations and Figure 6.3-9a for contaminant locations.

Building 3-17

At Building 3-17, neither the 1 sample collected for explosives analysis by the fixed laboratory, nor either of the 2 screening samples collected for explosives screening analysis, contained explosives above detection limits. All of these samples were collected east of the building around the loading docks and railroad tracks.

Building 3-16-1

Neither the 2 samples collected for explosives analysis by the fixed laboratory nor the 1 sample collected at Building 3-16-1 for explosives screening analysis contained explosives. All of these samples were collected east and north of the building around the loading dock, railroad tracks and doorways.

Building 3-16-2

At Building 3-16-2, 1 of the 2 samples collected for explosives analysis by the fixed laboratory reported explosives above detection limits. This sample was a confirmation sample for the screening sample discussed below. Explosives were detected at 1 screening sample location, R03-1701E, (out of 5 locations) in both the sample collected at 0.5 feet bgs and the sample collected at 1.0 feet bgs. See Figure 6.3-9k. R03-1701E is located adjacent to the southwest corner of the loading dock. There was no collocated 2.0 feet bgs sample. Samples collocated north, south and west of R03-1701E did not contain explosives.

Building 3-04

Explosives were not detected in any of the 4 samples collected for explosives screening analysis at Building 3-04, nor were explosives reported in the sample collected for explosives analysis by the fixed laboratory. All of these samples were collected around the loading docks and railroad tracks west of the building.

Building 3-01

Explosives were not detected in the sample sent to the fixed laboratory for explosives analysis from soil around Building 3-01. No explosives were detected in any of the 10 screening samples collected for explosives screening analysis at Building 3-01. All of these samples were collected around doorways, railroad tracks, and loading docks and their associated drainageways all around the building.

Building 3-08-2

Three samples were collected around Building 3-08-2 and sent to the fixed laboratory for explosives analysis. None of these samples reported explosives above detection limits. Explosives were detected at a depth of 1.0 feet bgs in 1 screening sample (R03-2201E-02) at Building 3-08-02. See Figure 6.3-9h for contaminant location. This sample was collected between the loading dock and railroad tracks. There was no collocated at-depth sample; however samples collected north, east, and south of this location did not contain explosives.

Building 3-08-1

Three samples were collected around Building 3-08-1 and sent to the fixed laboratory for explosives analysis. One of these samples reported explosives above detection limits. This sample was the confirmatory sample of Screening Sample R03-2401E-02.

This sample contained a high level of 2,4,6-TNT and was collected between the loading dock and the railroad tracks. See Figure 6.3-6f. Samples collected north, south, and east of R03-240E-02 did not contain explosives. See Figure 6.3-9f for screening sample contaminant locations.

Building 3-50

Four of 5 fixed laboratory sample locations collected around Building 3-50 (and its associated sumps) reported explosives results greater than detection limits. 2,4,6-TNT was the explosive reported at the highest value at all 4 locations. Two of the locations reported 2,4,6-TNT in the range of 10 to 100 $\mu\text{g/g}$. The other 2 locations reported 2,4,6-TNT less than 10 $\mu\text{g/g}$. One of the locations did not have a collected at-depth sample; 1 location did not report explosives in the collocated, 3.0 feet bgs sample; and the other 2 locations reported lower levels of explosives in the 3.0 feet bgs samples. Two of 43 screening samples (node 3900, 4000, 4100) collected around these Buildings contained detectable levels of explosives. See Figure 6.3-9g. 2,4,6-TNT and 1,3,5-TNB were the explosives reported with the highest values. Neither of these samples had collocated samples collected at-depth that did not report explosives. All of the screening and fixed laboratory samples were collected next to the sumps and doorways and their associated drainageways.

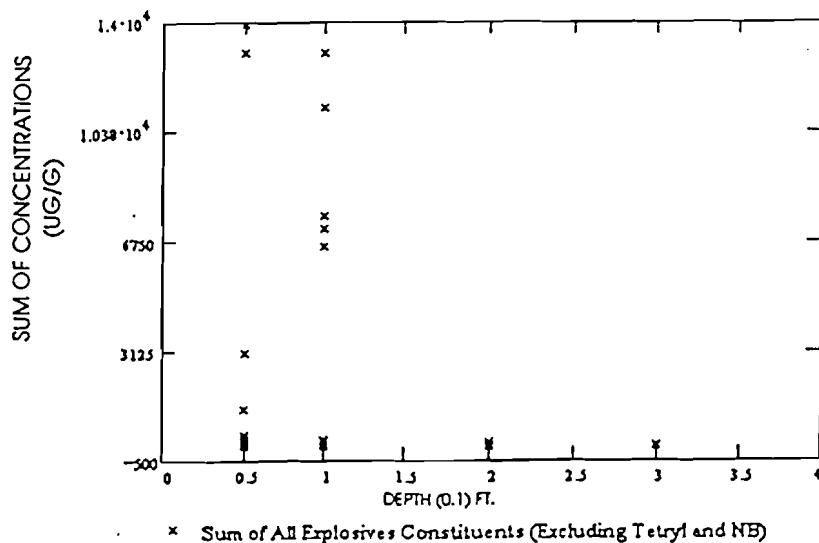

Summary

Field screening results indicated that 38 of 135 surface soil samples contained explosives. Further sampling at depth indicated explosives are confined within surficial soils and do not extend beyond approximately 10-20 feet from the most impacted soils. Soils exhibiting the highest concentrations of explosives are located at wastewater sumps, foundations of buildings where wastewater is generated (i.e., the melt buildings), and loading docks.

Continuous, undisturbed soil samples were collected during monitoring well installation. The soil samples were logged lithologically and a representative portion was placed in a resealable bag. Six soils samples were submitted for analysis to the fixed laboratory ranging in depth from 11.3 to 18 feet bgs. The sample from well JAW-54, collected at 15 feet bgs, contained RDX at 2.86 $\mu\text{g/g}$. Explosives were not detected at any of the other locations.

The following graph demonstrates the trend that total explosives levels in soil samples decrease with depth.

The concentrations decreased with depth and distance from the most impacted soils. The presence of clay-rich till under silty loess confined contamination to the uppermost 3 feet of soil and within an areal extent of approximately 10-20 feet from these most impacted soils.

The presence of surface features such as swales and ditches tends to channelize concentrations in near-surface soils. Near-surface storm water flow transports contaminants downgradient to local ponded areas. Soil samples collected during the RI delineate impacted soils and the extent of local migration in the surficial soils.

6.3.3.1.2 Surface Water and Sediment

Figure 6.3-10 depicts surface water/sediment contamination at Line 3. Samples RBW-SW/SD-41-01 were collected in a drainage channel, downgradient of NPDES outfall #033. The surface water sample contained explosives (1,3,5-TNB at 8.42 µg/L).

Samples RBW-SW/SD-38-01 were collected from a drainage channel, downgradient of NPDES outfall #032. The surface water and sediment samples both contained explosives at 36.7 µg/L (2,4,6-TNT) and 2.9 µg/g (1,3,5-TNB), respectively.

Samples R03-SW/SD-601 were collected along the east fenceline of Line 3, where the flow that originates south of Building 3-08-1 exits the line. Only the surface water sample contained explosives (RDX at 3.56 µg/L).

The southern portion of Line 3 drains to an un-named tributary of Brush Creek. Sampling from preferential drainage channels from Line 3 toward the creek has not revealed explosives in these drainage channels. Based on review of the results, it is not likely that Line 3 contributes explosive contamination to the tributary.

Concentrations of explosives have been identified in surface waters of the drainage channel immediately downgradient of NPDES discharges at Line 3. The intermittent nature of the drainage contributes to increased localized concentrations immediately downgradient of the discharge. Surface water fixed laboratory results are within the permitted NPDES limitations.

6.3.3.1.3 Groundwater

Figure 6.3-11 depicts locations and types of groundwater contamination at Line 3. The groundwater sample collected from R03-PZ-28 contained 2,4-DNT ($1.73 \mu\text{g}/\text{L}$) and RDX ($2,360 \mu\text{g}/\text{L}$). The location of the piezometer was in a swale, downgradient of the NPDES discharge and sumps around Building 3-05-1. Groundwater from R03-PZ-27, located 100 feet downgradient and east of R03-PZ-28, contained no explosives.

Monitoring well JAW-54 contained $2,110 \mu\text{g}/\text{L}$ of RDX and $2.06 \mu\text{g}/\text{L}$ of nitrobenzene. Well JAW-55 contained $6.89 \mu\text{g}/\text{L}$ of RDX. None of the other 4 monitoring wells contained explosives in the groundwater.

Concentrations of explosive related compounds have been identified in shallow groundwater in a swale area immediately downgradient of permitted effluent discharge and former wastewater treatment sumps near Building 3-05-1. The explosive compounds observed in the shallow groundwater and in surface water in nearby drainage ditches are localized near the discharges. Fixed laboratory results of soils and groundwater samples at locations further downgradient do not indicate explosive concentrations. NPDES outfalls #032 and #033 are each allowed $1,000 \mu\text{g}/\text{L}$ TNT and $5,000 \mu\text{g}/\text{L}$ RDX + HMX maximum 24-hour discharge. Intermittent or stagnant drainage from the discharges could result in the infiltration of the concentrations into the shallow groundwater. Although the groundwater tends to flow towards Brush Creek, the extent of groundwater contamination is limited to the area between Buildings 3-05-1, 3-05-2, and 3-50.

Significant explosive contamination (i.e., above health risk levels) does not generally exist below three feet in soils at this line. However, the explosives RDX, HMX, and nitrobenzene were reported in the groundwater at Line 3. RDX is a very mobile explosive contaminant and will most likely be found throughout the soil column. As learned from the Pinkwater Lagoon removal, 1 ppm of RDX in soil can contaminate groundwater above 2 ppb. Nitrobenzene is an impurity of the other forms of explosives used during manufacturing. HMX, although it appears in the groundwater, has a very high risk level in both groundwater and soils.

6.3.3.2 **Metals**

One hundred forty-five soil samples were analyzed by the fixed laboratory for metals from Line 3. Lead and barium were detected in all of the samples at levels up to 5790 and $1280 \mu\text{g}/\text{g}$, respectively. Arsenic and chromium were detected in 143 samples at levels up to 79 and $1460 \mu\text{g}/\text{g}$, respectively; cadmium was detected in 44 samples at levels up to $31.6 \mu\text{g}/\text{g}$; mercury was detected in 43 samples at levels up to $10 \mu\text{g}/\text{g}$; selenium was detected in 32 samples at levels up to $2.98 \mu\text{g}/\text{g}$; and silver was detected in 5 samples at levels up to $260 \mu\text{g}/\text{g}$.

A total of 13 aqueous samples was collected at Line 3 and analyzed for metals. Lead was detected in all 13 samples at levels up to $55.5 \mu\text{g}/\text{L}$; barium was detected in 11 samples at levels up to $148 \mu\text{g}/\text{L}$; and arsenic, chromium and mercury were each detected in 1 sample at 4.19, 16.8, and $0.791 \mu\text{g}/\text{L}$, respectively.

6.3.3.2.1 Soils

Elevated metals levels are more widespread throughout the building areas at Line 3 than explosives levels. The occurrence of metals is not concentrated at a particular building. The metal that represents a majority of the contamination is lead. Chromium is found to a lesser degree at the north end of the load line near Building 3-01, (load line storage). See Figure 6.3.8 for locations of fixed laboratory metals levels above 100 $\mu\text{g/g}$; see Figures 6.3-9a through -9l for locations of screening metals levels above 100 $\mu\text{g/g}$.

Building 3-04

Samples collected in the vicinity of Building 3-04 had the largest frequency of lead occurrence. Six of 7 fixed laboratory sample locations resulted in metals levels above 100 $\mu\text{g/g}$. One of the six locations resulted in lead levels above 1000 $\mu\text{g/g}$. This sample is located at the south end of Building 3-04. One of the 5 remaining samples had a lead concentration between 500 and 1000 $\mu\text{g/g}$, at the northeast corner of the building. The 4 remaining samples had metals levels ranging in concentration from 100 to 500 $\mu\text{g/g}$ and were located at the northwest corner of the building near the train tracks. Twenty-six samples from 10 locations were screened for metals around this building (node 1800). See Figure 6.3-6k. Metals were detected above 100 $\mu\text{g/g}$ at 8 locations. See Figure 6.3-9k. Five of these locations had collocated at-depth samples which did not contain metals above 100 $\mu\text{g/g}$.

Buildings 3-06-1 and 3-06-2

Five of 8 fixed laboratory samples collected around the 3-06 buildings contained lead above detection limits. Four of the samples contained lead levels between 100 and 500 $\mu\text{g/g}$. The remaining sample contained a lead level between 500 and 1000 $\mu\text{g/g}$. Eighteen samples from 8 locations (node 2600) were collected and screened for metals around Building 3-06-1 between the loading dock, doorways and railroad tracks. See Figure 6.3-6e. Metals were detected above 100 $\mu\text{g/g}$ in 5 locations. See Figure 6.3-9e. Three of these locations had collocated samples collected at depth that did not report metals levels above 100 $\mu\text{g/g}$. Thirty-four samples from 16 locations were collected and screened for metals around Building 3-06-2 between the loading dock, doorways and railroad tracks and their associated drainageways (node 400). See Figure 6.3-6j. Metals were detected above 100 $\mu\text{g/g}$ at 5 of these locations. See Figure 6.3-9j. Four locations had collocated samples collected at depth that did not report metals levels above 100 $\mu\text{g/g}$. Lead was the metal of concern reported at the highest value at all screening locations collected around the 3-06 buildings.

Building 3-05-2

The melt buildings had metals levels above 100 $\mu\text{g/g}$ in different areas around each building with no pattern or isolated location apparent. Building 3-05-2 had 6 of 15 fixed laboratory samples containing lead levels ranging from 100 to 500 $\mu\text{g/g}$. A total of 128 samples from 65 locations was collected and screened for metals around the sumps, doorways, loading docks and associated drainageways around this building (nodes 200, 1400, 1500, 2700, 2800, 2900, 3000, and 3100). See Figure 6.3-6i. Metals concentrations above 100 $\mu\text{g/g}$ were detected in 32 locations. See Figure 6.3-9i. Twenty of these locations had collocated at-depth samples which did not contain metals concentrations above 100 $\mu\text{g/g}$.

Building 3-05-1

Building 3-05-01 had 3 of 16 fixed laboratory samples that reported levels of metals above 100 $\mu\text{g/g}$. Lead was the metal with the highest value at all 3 locations. Two of the 3 samples contained lead ranging from 100 to 500 $\mu\text{g/g}$, while the third sample location resulted in a lead level above 1000 $\mu\text{g/g}$. A total of 103 samples from 56 locations was collected and screened for metals around the sumps, doorways, loading docks, and drainageways of this building (nodes 1200, 1300, 3200, 3300, 3400, 3500, 3600, and 3700). See Figure 6.3-6d. Metals concentrations above 100 $\mu\text{g/g}$ were found in 19 locations. See Figure 6.3-9d. Fourteen of these locations had collocated at-depth samples that did not contain metals concentrations above 100 $\mu\text{g/g}$.

Buildings 3-10, 3-16-1, and 3-17

There was a pattern to the metals contamination at Buildings 3-10, 3-16-1, and 3-17, all at the south end of the load line. Although frequency of detection was sporadic, all sample locations containing metals above 100 $\mu\text{g/g}$ at these 3 buildings were on the east side of the buildings, between the respective building loading dock and the train track. Building 3-10 had 3 of 9 fixed laboratory locations result in lead levels above 100 $\mu\text{g/g}$. The 3 sample locations had lead concentrations ranging from 100 to 500 $\mu\text{g/g}$. Sixty-one samples from 29 locations were collected around this building at doorways and the loading docks (nodes 800, 900, 1000, 1100, and 3800). See Figure 6.3-6c. Metals concentrations above 100 $\mu\text{g/g}$ were reported at 16 locations. See Figure 6.3-9c. Eight of these locations had collocated at-depth samples which did not contain metals.

Building 3-16-1 had 2 of 4 fixed laboratory samples containing lead above 100 $\mu\text{g/g}$, with concentrations between 100 and 500 $\mu\text{g/g}$. A total of 18 samples from 10 locations was collected and screened for metals west and north of this building (node 4200). See Figure 6.3-6b. Three of these locations reported metals levels above 100 $\mu\text{g/g}$. See Figure 6.3-9b. All 3 locations had collocated samples collected at depth that did not report levels of metals greater than 100 $\mu\text{g/g}$.

One of 5 fixed laboratory locations collected at Building 3-17 reported metals levels greater than 100 $\mu\text{g/g}$. This sample's highest metal level was also in the 100 to 500 $\mu\text{g/g}$ range. Nineteen samples from 10 locations were collected and screened for metals west of this building (node 4300). See Figure 6.3-6b. Six of these locations reported metals levels above 100 $\mu\text{g/g}$. See Figure 6.3-9b. Four of these locations had collocated at-depth samples that did not report metals levels above 100 $\mu\text{g/g}$.

Building 3-12

Building 3-12 had 4 of 11 fixed laboratory samples result in lead levels greater than 100 $\mu\text{g/g}$. Two samples were collected between the northern loading dock and railroad tracks. The other 2 samples were collected east of the building. Three of the 4 sample locations had lead levels between 100 and 500 $\mu\text{g/g}$. The remaining sample location had a lead concentration between 500 and 1000 $\mu\text{g/g}$. Eighty-four metals screening samples were collected from 37 locations east and west of the building (nodes 500, 600, and 700). See Figure 6.3-6a. Nineteen locations contained metals concentrations above 100 $\mu\text{g/g}$; 11 of these locations had collocated at-depth samples which did not contain metals levels above 100 $\mu\text{g/g}$. See Figure 6.3-9a.

Buildings 3-50, 3-08-1, 3-08-2, and 3-03

Buildings 3-50, 3-08-1, 3-08-2, and 3-03 had samples reporting lead levels above 100 $\mu\text{g/g}$ at the loading dock areas. All sample locations that resulted in elevated lead levels had concentrations between 100 and 1000 $\mu\text{g/g}$. Building 3-50 had 2 of 7 fixed laboratory locations result in metals levels between 100 and 500 $\mu\text{g/g}$. One of the 26 samples collected and screened for metals around this building (nodes 3900, 4000, and 4100) reported levels of metals above 100 $\mu\text{g/g}$. See Figure 6.3-9g. This sample was collected northeast of Building 3-140-2 and reported lead above 1000 $\mu\text{g/g}$.

Building 3-03 had a fixed laboratory sample reporting lead above 100 $\mu\text{g/g}$ at the loading dock on the west side between the building and the train tracks. The sample concentration was between 500 and 1000 $\mu\text{g/g}$.

At Building 3-08-1, 1 of 3 samples sent to the fixed laboratory for metals analysis reported metals levels in the range of 500 to 1000 $\mu\text{g/g}$. This sample was a confirmatory sample for Screening Sample R03-2401M-02. Twenty-eight samples from 14 locations were collected and screened for metals east and south of the building (node 2400). See Figure 6.3-6f. Metals concentrations greater than 100 $\mu\text{g/g}$ were reported at 5 locations. See Figure 6.3-9f. Three of these locations had collocated samples collected at-depth that did not report metals levels greater than 100 $\mu\text{g/g}$.

At Building 3-08-2, none of the samples analyzed for metals by the fixed laboratory reported metals levels greater than 100 $\mu\text{g/g}$. Nineteen samples from 13 locations were collected and screened for metals east, north, and south of the building (node 2200). See Figure 6.3-6h. Metals concentrations greater than 100 $\mu\text{g/g}$ were reported at 3 locations. See Figure 6.3-9h. None of these locations had collocated samples collected at-depth that did not report metals levels greater than 100 $\mu\text{g/g}$.

Building 3-16-2

Samples were collected and analyzed for metals by the fixed laboratory from 2 locations east and west of Building 3-16-2. Metals concentrations above 100 $\mu\text{g/g}$ were reported at 1 location (lead greater than 1000 $\mu\text{g/g}$) east of the building. Twenty-one samples from 12 locations were collected and screened for metals south, west, and north of the building (node 1700). See Figure 6.3-6k. Metals concentrations greater than 100 $\mu\text{g/g}$ were reported at 4 locations. See Figure 6.3-9k. All 4 of these locations had collocated samples collected at-depth that did not report metals levels greater than 100 $\mu\text{g/g}$.

Building 3-01

Samples were collected from 9 locations around Building 3-01 and its associated drainageways and sent to the fixed laboratory for metals analysis. Three of these locations reported metals concentration greater than 100 $\mu\text{g/g}$. Lead was reported at levels between 100 and 500 $\mu\text{g/g}$ and 500 to 1000 $\mu\text{g/g}$ near the building's baghouse. Chromium was reported at a level between 100 and 500 $\mu\text{g/g}$ in the drainage swale east of the building. Forty-four samples from 35 locations were collected and screened for metals around Building 3-01 (nodes 300, 1900, 2000, and 21000) See Figure 6.3-6l. Samples were collected around the loading docks and railroad tracks, around doorways, and in the drainageways running east from the building. Seven of these samples reported metals (lead and chromium) at levels greater than 100 $\mu\text{g/g}$. See Figure 6.3-9l.

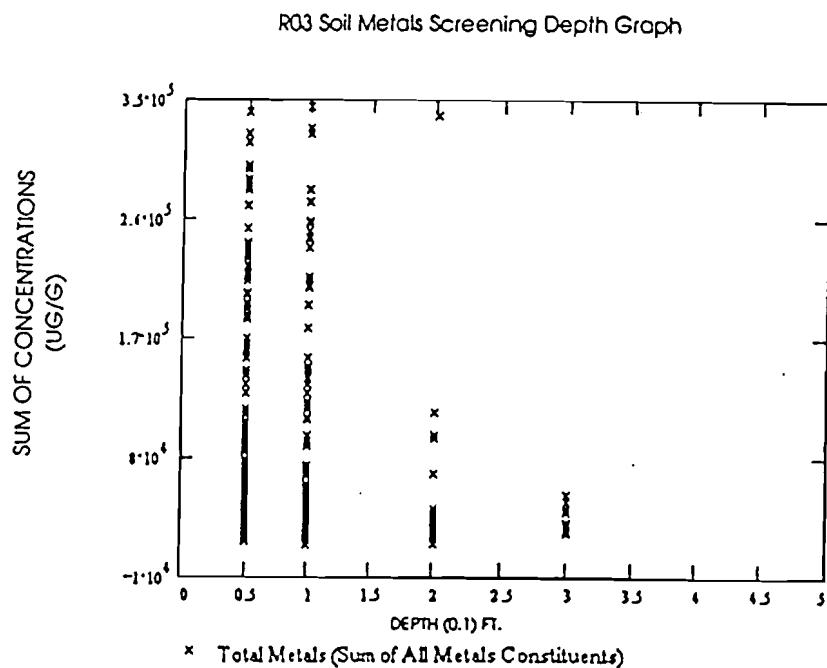

Four of these locations had collocated samples collected at depth that did not report metals levels greater than 100 $\mu\text{g/g}$.

At-Depth Samples

Continuous undisturbed soil samples were collected from the soil borings during monitoring well installation. The soil samples were logged lithologically and a representative portion was placed in a resealable bag. Six soils samples were submitted to the fixed laboratory for analysis ranging in depth from 11.3 to 18 feet bgs. None of these samples reported metals concentrations above 100 $\mu\text{g/g}$.

Summary

Metals screening analysis indicated that 267 of the 332 surface soil samples contained metals. Further sampling revealed significant decreases in concentrations with depth. The following graph demonstrates the trend for total metals levels in soil samples to decrease with depth.

Metals concentrations also decreased as the distance from the most impacted soils increased. The areal extent of impacted soils is generally within 10-20 feet of historical sources. The areal extent can vary dependent on the existence of surface features that may channelize and concentrate contaminants. Swales and drainage ditches immediately downgradient from impacted soils were found to have higher concentrations and further horizontal extent of contamination. All concentrations, however, were confined to surficial soils by clay-rich till.

6.3.3.2.2 Surface Water and Sediment

The southern portion of Line 3 drains to an unnamed tributary of Brush Creek. Minor amounts of metals were identified in the tributary which also drains portions of Lines 6, 7, and 9. Sampling from preferential drainage channels from Line 3 toward the creek has not revealed metals contamination. Based on review of the results, it is not likely that Line 3 contributes contamination to the tributary.

Concentrations of metals have been identified in surface waters of the drainage channel immediately downgradient of NPDES discharges at Line 3. Metals were detected in the drainage channel sediments. The intermittent nature of the drainage contributes to increased localized concentrations immediately downgradient of the discharge. Surface water fixed laboratory results are within the permitted NPDES limitations.

6.3.3.2.3 Groundwater

Concentrations of lead between 1.0 and 10 $\mu\text{g}/\text{L}$ were found in wells JAW-53, JAW-56, JAW-57, and JAW-77. Pervasive metals contamination in groundwater at Line 3 does not appear to occur.

6.3.3.3 VOCs and SVOCs

Soil gas screening of the vadose zone was conducted around the Line 3 storage Building 3-03. The soil gas survey examined 21 sampling locations at depths ranging from 5 to 15 feet. Seven of the 21 sample locations were reported to have detectable levels of Total VOCs. The concentrations ranged from below detection limit to 1,462 $\mu\text{g}/\text{L}$ at 1 sample location.

During the Follow-on sampling, 2 samples were collected and analyzed for VOCs to confirm earlier soil gas results. Sample R03-SA-610 was collected at 5.0 feet bgs at former soil gas survey point R03-01 (between Building 3-03 and the railroad tracks), where 1462 ppb TVOCs were reported. During sampling, a black-stained soil with a petroleum odor was encountered at 4.0 feet bgs. No reading was reported on the OVA. Sampling was conducted according to work plan protocol for sampling soils for VOCs. Acetone was reported at 0.055 $\mu\text{g}/\text{g}$ in Sample R03-SA-610. Sample R03-SA-611 was collected at 5.0 feet bgs at former soil gas survey point R03-13 (near Building 3-03), where no TVOCs were reported. Acetone was reported in this sample at 0.0430 $\mu\text{g}/\text{g}$. A field duplicate of Sample R03-SA-611 was collected and reported acetone at 0.0450 $\mu\text{g}/\text{g}$. The soil was extremely saturated at this depth at this location indicating that shallow groundwater had been encountered.

Building 3-03 is a solvent storage building. Any VOC contamination in the area would be from incidental spills during handling or building clean-up. A waste stream is not generated in this building, therefore if any contamination exists, it may be in small amounts that is not concentrated to one area (i.e., ditch). It may be difficult to determine the best areas to sample with an inconsistent source as described. As discussed previously, since the soil gas survey suggested that contamination exists at this building, this area will be evaluated under the Groundwater FS. Extraction wells may be installed that would capture contaminants.

None of the surface water/sediment samples collected during the RI at Line 3 reported levels of SVOCs above detection limits. Only one of the surface water samples collected from Line 3 reported VOCs above detection limits. Sample R03-SW-46 reported chloroform, bromodichloromethane, and ethylbenzene at 27.0, 4.6 and 0.9 $\mu\text{g}/\text{L}$, respectively. This sample was collected 63 feet south of the southeast corner of Building 3-70-2 (i.e., from the outfall area of the filter building). No VOCs or SVOCs were reported in the corresponding sediment sample.

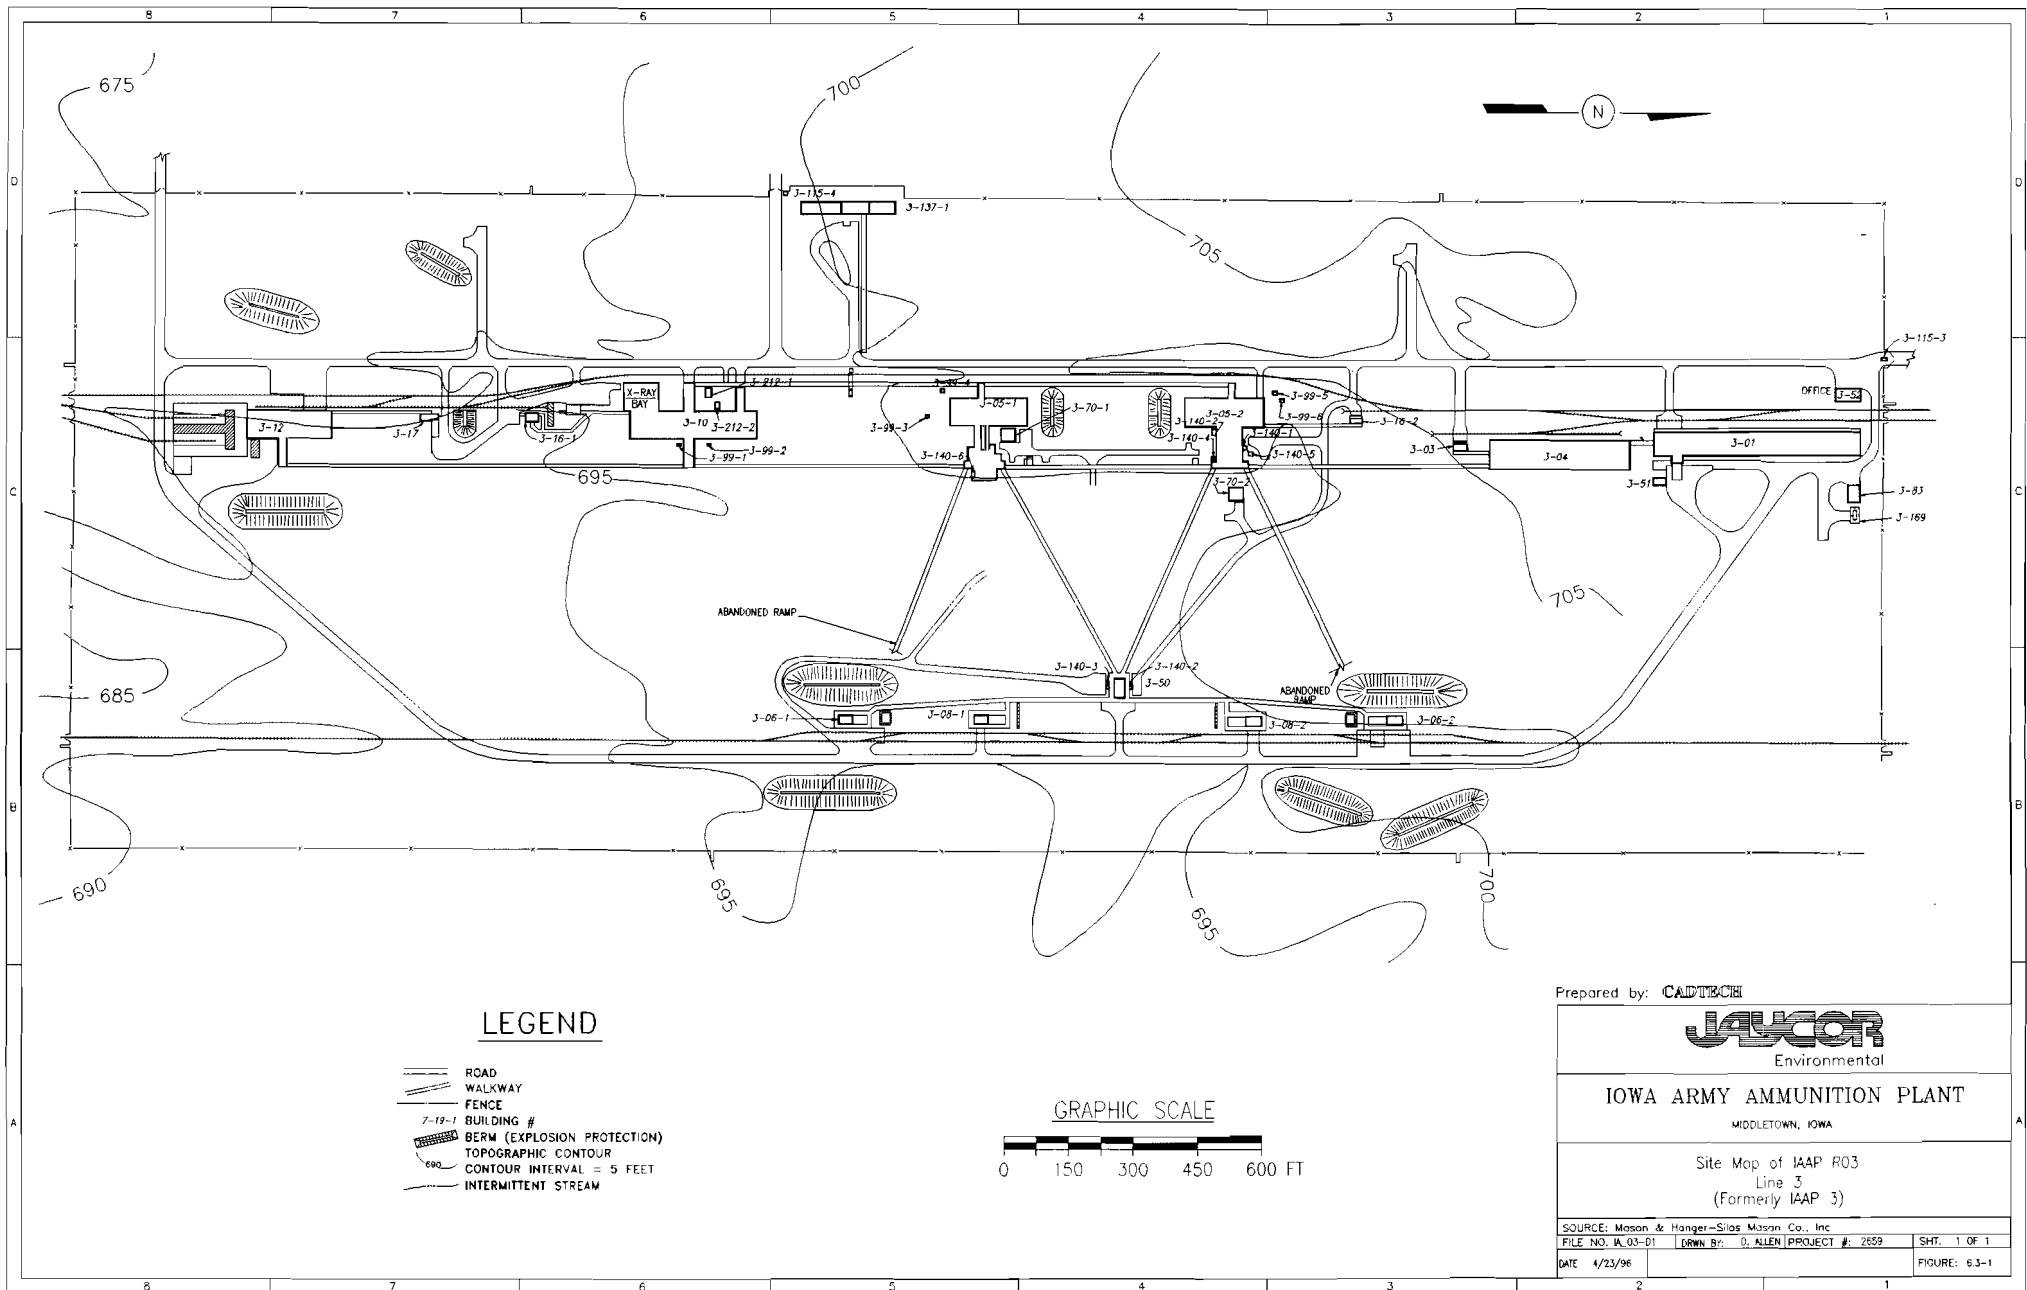

During the Follow-on sampling, Wells JAW-53, JAW-55, and JAW-56 were sampled to determine if VOCs were a concern in the groundwater, per EPA Region VII request. VOCs were not detected in any of these wells during the Follow-on sampling.

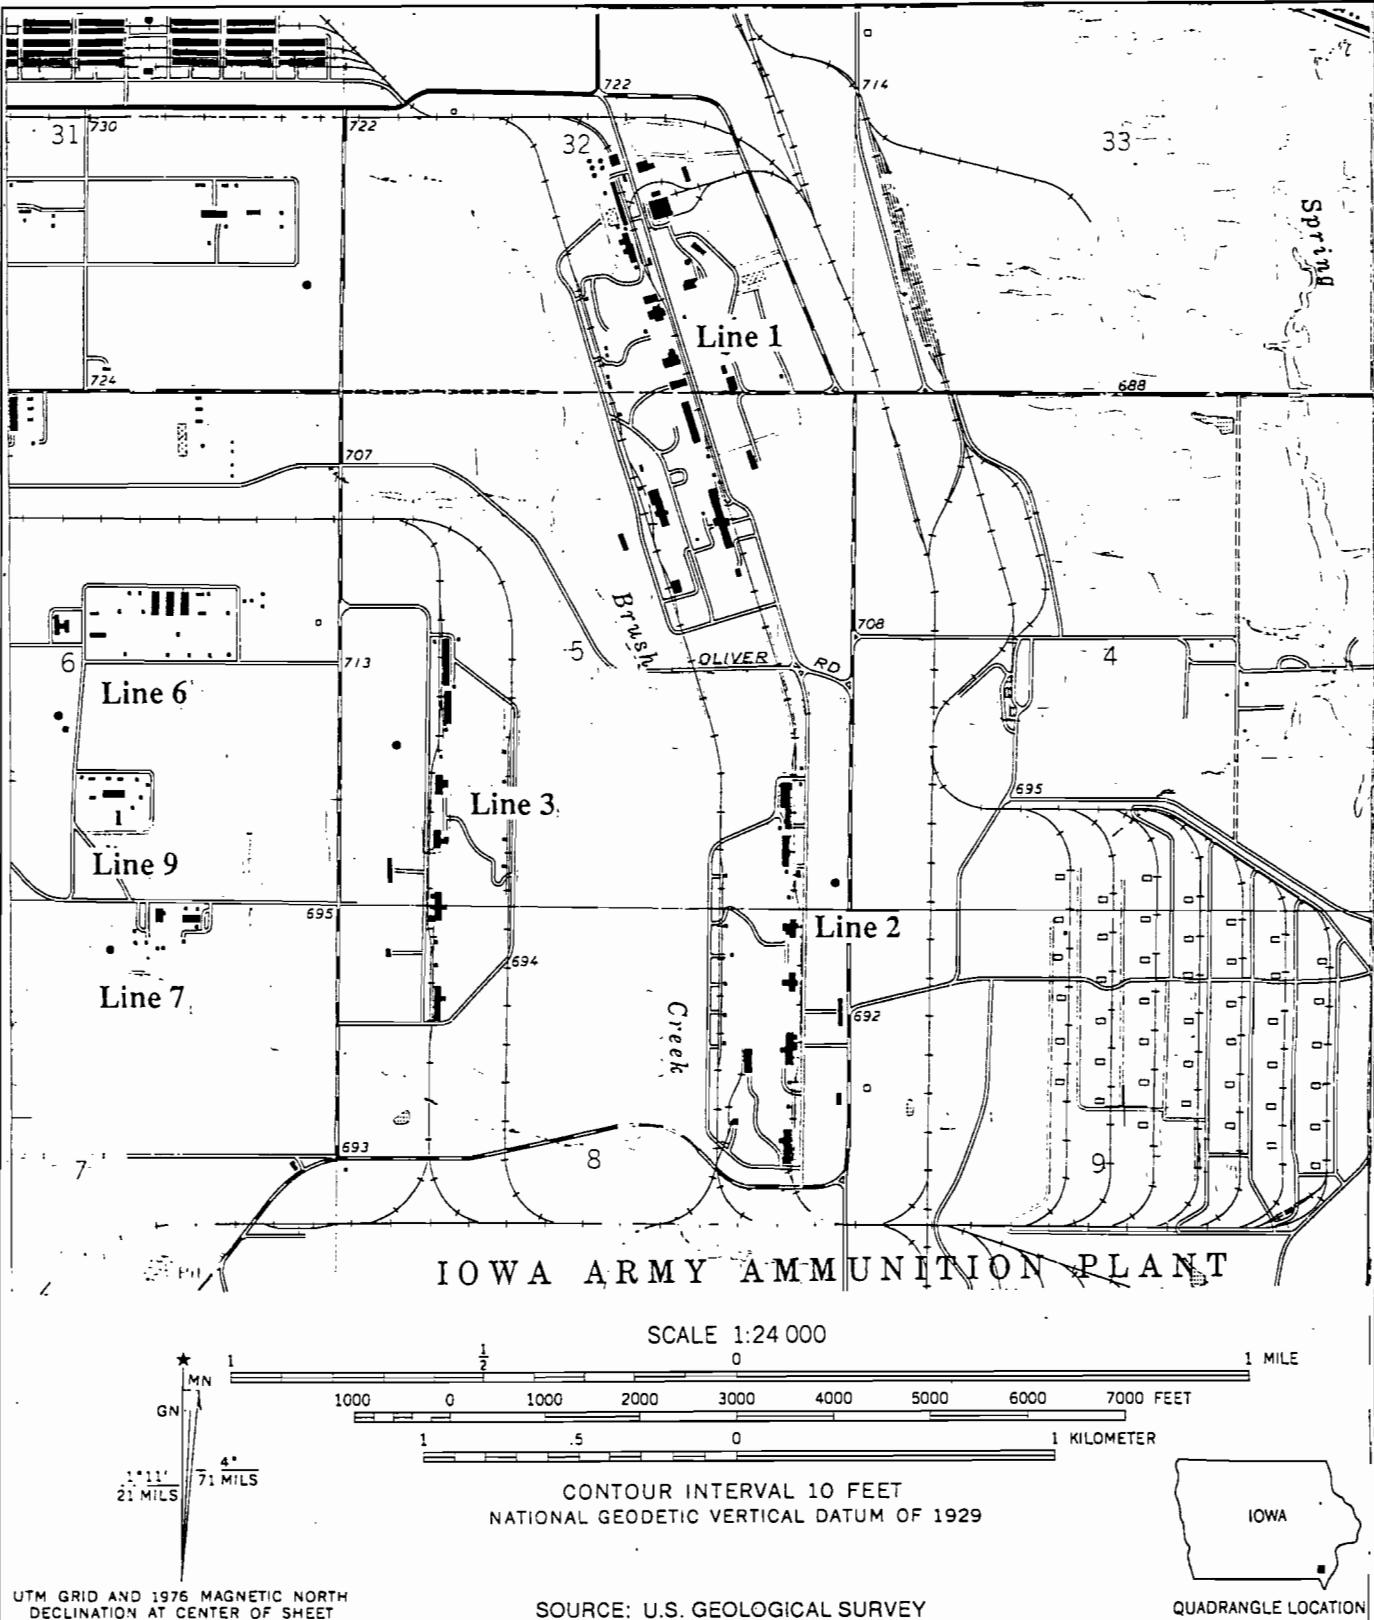

Several SVOCs were reported in soil samples collected throughout Line 3. With the exception of one sample, none of these levels were above 10 $\mu\text{g}/\text{g}$. (Sample 03-SA-09 reported Benzo[ghi]perylene at 21 $\mu\text{g}/\text{g}$.) Other SVOCs reported in soil samples include di-n-butyl phthalate, bis(2-ethylhexyl)phthalate, fluoranthene, benzo[def]phenanthrene, benzo[b]fluoranthene, and phenol. Only 1 sample reported detectable levels of VOCs: toluene at 0.0016 $\mu\text{g}/\text{g}$ in Sample R03-SS-08. See Figure 6.3-8 for locations of SVOC and VOC detects in soil samples.

6.3.4 Deviations from the Work Plan

Samples R03-GP-39-01 and R03-GP-40-01 were designated as soil gas confirmation samples in the RI Work Plan. Ten percent of the total number of soil gas samples were sent to the fixed laboratory for confirmation; however, not as many soil gas samples collected from Line 3 were selected for confirmation samples as originally planned. Therefore, these sample numbers were not needed.

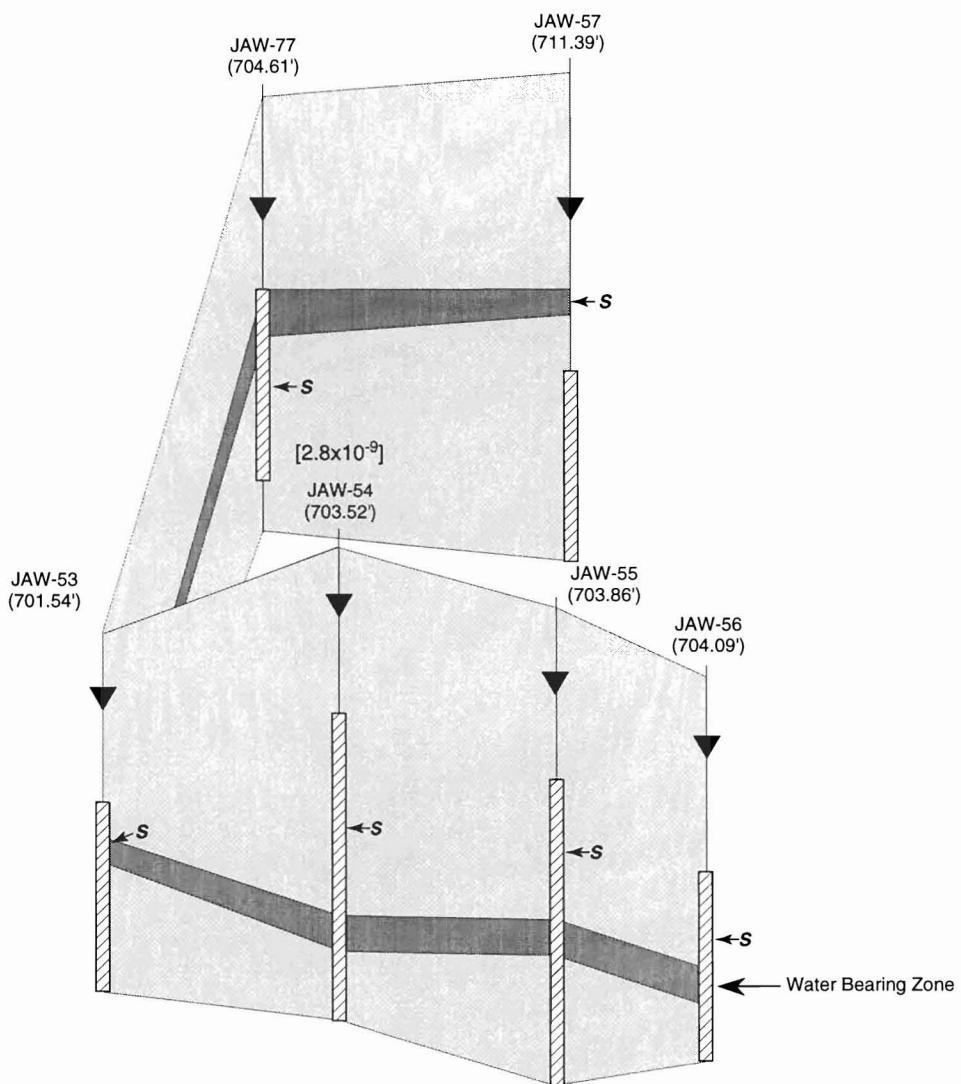

Sample R03-GP-41-01 was designated as a soil gas confirmation sample in the RI Work Plan. Because of the reason stated in the above paragraph, this sample number was not needed for soil gas confirmation. This number was instead used as the starting number for metals and explosives screening samples collected from Line 3 and selected for confirmation by the fixed laboratory. Sample numbers R03-SS-41 through R03-SS-134 were all used to identify screening confirmation samples.

**Table 6.3-1
Sample Summary
Line 3 (R03)**

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
03-SS-01-01	SI	Explosives, Metals SVOCs, VOCs	C	A	0.0-0.5	N of baghouse by Building 3-01.
03-SA-02-01	SI	Explosives, Metals SVOCs, VOCs	C	A	0.0-1.0	22' N of Building 3-70-2 near a discharge pipe.
03-SA-03-01	SI	Explosives, Metals SVOCs, VOCs	C	A	3.0-4.0	7' S of the Settling Tank 3-163-2.
03-SA-04-01	SI	Explosives, Metals SVOCs, VOCs	C	A	0.0-2.0	10' N of Building 3-70-2.
03-SA-05-01	SI	Explosives, Metals SVOCs, VOCs	C	A	0.0-1.0	24' S of Building 3-163-2.
03-SS-06-01	SI	VOCs	G	A	0.5	50' S of Building 3-04, under walkway.
03-SD-07-01	SI	Explosives, Metals SVOCs, VOCs	G	A	0.5	28' SE of Building 3-70-2.
03-SW-07-01	SI	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to SD-07-01.
03-SA-08-01	SI	Explosives, Metals SVOCs, VOCs	G	A	1.0	Along E side of Building 3-70-2.
03-SA-09-01	SI	Explosives SVOCs, VOCs	C	A	0.0-1.0	Adjacent to the sump NE of Building 3-70-1.
03-SA-09-02	SI	Explosives, Metals SVOCs, VOCs	C	A	1.25-1.8	Same location as SA-09-01; sample depth adjusted from 18-24" due to refusal in fill.
03-SS-10-01	SI	Metals Radionuclides Pest./PCBs	G	A	0.5	4' N of Transformer Area 3-169-6.
03-SS-11-01	SI	Explosives, Metals	C	A	0.0-0.5	4 locations at 2 buildings (3-08-2 and 3-06-2).

SI = Site Investigation
S = Screening Sample

I = Phase 1 RI/FS
G = Grab

II = Phase 2 RI/FS
A = Analytical Sample

SS = Sump Survey
C = Composite

FO = Follow-on RI/FS
NA = Not Applicable

Table 6.3-1 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
03-SS-12-01	SI	Explosives, Metals	C	A	0.0-0.5	Composite from three aliquots spaced 5' apart near loading dock at Building 3-08-1.
R03-SS-01-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	E corner of connection point between Building 3-12 and new building to the N.
R03-SS-02-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	15' S of NW corner of Building 3-12, in front of northernmost loading dock.
R03-SS-03-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	15' S of NE corner of Building 3-17, adjacent to E wall.
R03-SS-04-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	12' N of NW corner of fire containment wall and 50' NW of NW corner of Building 3-16-1.
R03-SS-05-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	8' E of NW corner of X-ray Building.
R03-SS-06-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	E wall of Building 3-10, N of stairs.
R03-SS-07-01	I	Explosives, Metals SVOCs, VOCs	G	S	0.5	15' S of NW corner of Building 3-10, adjacent to wall.
R03-SS-08-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	45' SE of stairs on SE corner of Building 3-05-1.
R03-SS-09-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	40' N and 30' E of walkway 3-82-9
R03-SS-10-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	40' E of SE wall of Building 3-05-2.
R03-SS-11-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	6' N of intersection of Building 3-05-2 and northward extending walkway in center of walkway.
R03-SS-12-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	6' S and 20' E of NE corner of Building 3-16-2.

SI = Site Investigation
 S = Screening Sample

I = Phase 1 RI/FS
 G = Grab

II = Phase 2 RI/FS
 A = Analytical Sample

SS = Sump Survey
 C = Composite

FO = Follow-on RI/FS
 NA = Not Applicable

Table 6.3-1 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R03-SS-13-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	4' E and 36' N of SE corner of Building 3-03.
R03-SS-14-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	115' S of SW corner of Building 3-01 and 20' W of Building 3-04.
R03-SS-15-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	45' E and 8' N of NE corner of Building 3-06-2.
R03-SS-16-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	62' S of SE corner of Building 3-06-2.
R03-SS-17-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	6' E of intersection between walkway and SW extension of Building 3-08-2.
R03-SS-18-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	6' N of SE corner of Building 3-08-2.
R03-SS-19-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	18' S of SE corner of Building 3-50.
R03-SS-20-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	105' S and 15' W of Building 3-08-1.
R03-SS-21-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	9' N of SW corner of Building 3-06-1.
R03-SS-22-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	4' N of NW corner of Building 3-06-1.
R03-PZ-23-01	I	Explosives	G	S	25.0	Groundwater sample corresponds to R03-GP-23-01.
R03-PZ-24-01	I	Explosives	G	S	18.0	Groundwater sample corresponds to R03-GP-24-01.
R03-PZ-25-01	I	Explosives	G	S	18.0	Groundwater sample corresponds to R03-GP-25-01.
R03-PZ-26-01	I	Explosives	G	S	18.0	Groundwater sample corresponds to R03-GP-26-01.
R03-PZ-27-01	I	Explosives	G	S	18.0	Groundwater corresponds to R03-GP-27-01.

SI = Site Investigation
S = Screening Sample

I = Phase 1 RI/FS
G = Grab

II = Phase 2 RI/FS
A = Analytical Sample

SS = Sump Survey
C = Composite

FO = Follow-on RI/FS
NA = Not Applicable

Table 6.3-1 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R03-PZ-28-01	I	Explosives	G	S	18.0	Groundwater sample corresponds to R03-GP-28-01.
R03-SW-35-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	27' SE of SE corner of Building 3-70-2.
R03-SD-35-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to sample R03-SW-35-01.
R03-SW-36-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	135' E of Line 3-82-9.
R03-SD-36-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to sample R03-SW-36-01.
R03-SW-37-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	In drainage pathway running underneath walkway which connects Building 3-140-6 to Building 3-140-2, E of road.
R03-SD-37-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to sample R03-SW-37-01.
R03-SA-38-01	I	SVOCs, VOCs	G	A	4.0	1' from loading dock on W face of Building 3-03; corresponds to survey point R03-01.
R03-SA-41-01	I	SVOCs, VOCs	G	A	4.0	1' S of Building 3-03, corresponds to survey point R03-04.
R03-SS-44-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-1201-E-01.
R03-SS-45-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-3301-E-01.
R03-SW-46-01	I	Explosives, Metals SVOCs, VOCs	G	A	N/A	63' S of SE corner of Building 3-70-2.
R03-SD-46-01	I	Explosives, Metals SVOCs, VOCs	G	A	0.5	Corresponds to R03-SW-46-01.
R03-SS-47-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-4201-E-01.
R03-SS-48-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-2707-E-01.

SI = Site Investigation
S = Screening Sample

I = Phase 1 RI/FS

Table 6.3-1 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R03-SS-49-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-901-E-01.
R03-SS-50-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-2805-E-01.
R03-SS-51-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-1001-E-01.
R03-SS-52-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-2702-E-02.
R03-SS-53-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-2701-E-02.
R03-SS-54-01	I	Explosives	G	S	0.5	Explosives confirmatory sample for R03-2709-E-01.
R03-SA-55-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-2601-E-02.
R03-SA-56-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-2401-E-02.
R03-SA-57-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-3201-E-02.
R03-SA-58-01	I	Explosives	G	S	1.0	Explosives confirmatory sample for R03-1701-E-02.
R03-SS-59-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-4204-M-01.
R03-SS-60-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-707-M-01.
R03-SS-61-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-708-M-01.
R03-SS-62-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-506-M-01.
R03-SS-63-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-509-M-01.
R03-SA-64-01	I	Metals	G	S	1.0	Metals confirmatory sample for R03-2002-M-02.
R03-SA-65-01	I	Metals	G	S	1.0	Metals confirmatory sample for R03-401-M-02.
R03-SS-66-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-803-M-01.
R03-SS-67-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-804-M-01.
R03-SA-68-01	I	Metals	G	S	1.0	Metals confirmatory sample for R03-3501-M-02.

Table 6.3-1 (Continued)

RI Sample Number	Phase	Analyses	Sample Type	Sample Category	Depth (feet)	Location
R03-SA-132-01	I	Metals	G	S	1.0	Metals confirmatory sample for R03-312-M-02.
R03-SS-133-01	I	Metals	G	S	0.5	Metals confirmatory sample for R03-313-M-01.
R03-SS-134-01	I	Explosives	G	S	0.0	Explosives confirmatory sample for R03-4101-E-01 (originally Sample R03-SS-46. Sample ID changed to avoid confusion with Sample R03-SD-46).
R03-GW-501-01	II	Explosives, Metals	G	A	4.4	JAW-53 located approximately 160' SE of Building 3-140-6.
R03-SA-501-01	II	Explosives, Metals	G	A	10.0	Soil sample collected from JAW-53.
R03-GW-502-01	II	Explosives, Metals	G	A	4.2	JAW-54 located approximately 120' NE of Building 3-140-6.
R03-SA-502-01	II	Explosives, Metals	G	A	15.0	Soil sample collected from JAW-54.
R03-GW-503-01	II	Explosives, Metals	G	A	4.9	JAW-55 located approximately 200' SE of Building 3-05-2.
R03-SA-503-01	II	Explosives, Metals	G	A	13.0	Soil sample collected from JAW-55.
R03-GW-504-01	II	Explosives, Metals	G	A	4.7	JAW-56 located approximately 120' NE of Building 3-05-2.
R03-SA-504-01	II	Explosives, Metals	G	A	12.5	Soil sample collected from JAW-56.
R03-GW-505-01	II	Explosives, Metals	G	A	7.0	JAW-57 located approximately 170' W of Building 3-05-2.
R03-SA-505-01	II	Explosives, Metals	G	A	11.0	Soil sample collected from JAW-57.
R03-GW-506-01	II	Explosives, Metals	G	A	6.3	JAW-77 located approximately 220' W of Building 3-05-1.
R03-SA-506-01	II	Explosives, Metals	G	A	15.0	Soil sample collected from JAW-77.
R03-SW-506-01	II	Explosives, Metals	G	A	0.0	S of Line 3 in a drainage ditch.
R03-SD-506-01	II	Explosives, Metals	G	A	0.5	Corresponds to R03-SW-506-01.
R03-SW-507-01	II	Explosives, Metals	G	A	0.0	S of Line 3 in a drainage ditch.
R03-SD-507-01	II	Explosives, Metals	G	A	0.5	Corresponds to R03-SW-507-01.
