Data Group ID for HHRA	StationID	Sample ID (1)	Matrix	Date Collected	Upper Depth	Lower Depth	Parameter Name	Result	Qualifier	Units	Detection Limit	Reporting Limit

Notes:
(1) The data were reduced such that when a normal and duplicate sample were available, the highest detected concentration among normal or duplicate samples was used when a chemical was detected in any sample. If both results were non-detect, the lowest reported detection limit (i.e., reporting limit) was used.
NA = Not available
WG - groundwater
J - compound was detected below the reporting limit in the sample
= - detected
U - not detected
µg/L - microgram per liter

ProUCL Output - Groundwater (RDX Plume Core), Potable Use Scenario

Iowa Army Ammunition Plant, West Burn Pads Area, Middletown, Iowa

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/21/2021 12:43:03 PM
From File	ProUCL Input_WBP Plume_Potable.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

2-Amino-4,6-dinitrotoluene

General Statistics

Total Number of Observations	22	Number of Distinct Observations	9
Number of Detects	6	Number of Non-Detects	16
Number of Distinct Detects	6	Number of Distinct Non-Detects	3
Minimum Detect	0.068	Minimum Non-Detect	0.1
Maximum Detect	0.54	Maximum Non-Detect	0.13
Variance Detects	0.0456	Percent Non-Detects	72.73%
Mean Detects	0.34	SD Detects	0.214
Median Detects	0.425	CV Detects	0.628
Skewness Detects	-0.77	Kurtosis Detects	-1.86
Mean of Logged Detects	-1.382	SD of Logged Detects	0.984

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.798	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.788	Detected Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.312	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.325	Detected Data appear Normal at 5% Significance Level

Detected Data appear Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

KM Mean	0.144	KM Standard Error of Mean	0.0368
KM SD	0.157	95% KM (BCA) UCL	0.216
95% KM (t) UCL	0.208	95% KM (Percentile Bootstrap) UCL	0.206
95% KM (z) UCL	0.205	95% KM Bootstrap t UCL	0.205
90% KM Chebyshev UCL	0.255	95% KM Chebyshev UCL	0.305
97.5% KM Chebyshev UCL	0.374	99% KM Chebyshev UCL	0.511

Gamma GOF Tests on Detected Observations Only

A-D Test Statistic	0.875	**Anderson-Darling GOF Test**
5% A-D Critical Value	0.706	Detected Data Not Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.372	**Kolmogorov-Smirnov GOF**
5% K-S Critical Value	0.337	Detected Data Not Gamma Distributed at 5% Significance Level

Detected Data Not Gamma Distributed at 5% Significance Level

Gamma Statistics on Detected Data Only

k hat (MLE)	1.792	k star (bias corrected MLE)	1.007
Theta hat (MLE)	0.19	Theta star (bias corrected MLE)	0.338
nu hat (MLE)	21.5	nu star (bias corrected)	12.08
Mean (detects)	0.34		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.17
Maximum	0.54	Median	0.0986
SD	0.165	CV	0.968
k hat (MLE)	1.033	k star (bias corrected MLE)	0.923
Theta hat (MLE)	0.165	Theta star (bias corrected MLE)	0.184
nu hat (MLE)	45.47	nu star (bias corrected)	40.6
Adjusted Level of Significance (β)	0.0386		
Approximate Chi Square Value (40.60, α)	27	Adjusted Chi Square Value (40.60, β)	26.17

Detected Data appear Approximate Gamma Distributed at 5% Significance Level

Suggested UCL to Use

a Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	276

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test

When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

ATTACHMENT 4

Non-detected Data Analysis: West Burn Pads Area

Chemicals that were 100 percent (%) non-detected (ND) in a data grouping were not identified as COPCs for that data grouping; however, a qualitative evaluation of the 100 % ND chemicals within the West Burn Pads (WBP) Area media was conducted. For this HHRA, the WBP media consisted of surface water, sediment and groundwater. However, no ND sediment chemicals had detection limits (DLs) or reporting limits (RLs) that were greater than screening levels (SLs), and as a result, the ND analysis was limited to surface water and groundwater data.

Surface water SLs are USEPA Regional Screening Levels (RSLs) for a recreational scenario calculated using an excess lifetime cancer risk (ELCR) of $1x10^{-6}$ and a hazard quotient (HQ) of 1 (USEPA, 2023). Groundwater SLs are the USEPA RSLs for tap water (USEPA, 2023) using an ELCR of $1x10^{-6}$ and a HQ of 1. The WBP ND chemicals and a comparison of the ND DLs and RLs to SLs is provided in Attachment 4 Table 1a (surface water) and Table 1b (groundwater). ND chemicals exceeding SLs are identified and discussed below with regard to the frequency of exceedance and potential to be related to former site activities.

Non-detected Chemicals Exceeding Screening Levels

Surface Water

In surface water, one metal (chromium) and one volatile organic compound ([VOC] 1,2,3-trichloropropane) have DLs and RLs greater than SLs. A data set of 2 samples each was available for chromium and 1,2,3-trichloropropane. Three explosives (DNX, MNX and TNX), one semi-volatile organic compound (SVOC; 1,3-dichlorobenzene) and 9 VOCs (1,3-dichlorobenzene, 1,1-dichloropropene, 1-chlorohexane, 2,2-dichloropropane, 4-isopropyltoluene, bromochloromethane, chloromethane, chloroethane, dibromomethane and methyl isobutyl ketone) were consistently ND in the WBP surface water data set, but SLs were not available for these ND chemicals. Therefore, those ND chemicals were not included in the ND assessment process.

Groundwater

In groundwater, 3 explosives (2,4-dinitrotoluene, 2-nitrotoluene and nitrobenzene), one metal (chromium), 3 ([SVOCs] 1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene), and 24 VOCs have RLs or DLs exceeding SLs at the WBP. Two ND explosives (2,4-dinitrotoluene and 2-nitrotoluene) and 3 ND VOCs (bromobenzene, bromochloromethane and chlorobenzene) had RLs that were greater than SLs but no DLs greater than SLs. ND analytes with DLs and/or RLs greater than SLs had a dataset of 29 samples per explosive, 8 samples for chromium, and 25 samples for SVOCs and VOCs. One SVOC (1,3-dichlorobenzene) and 2 VOCs (1,1-dichloropropene and 2,2-dichloropropane) were consistently ND in the WBP groundwater data set, but SLs were not available for these ND chemicals. Therefore, those ND chemicals were not included in the ND assessment process.

Non-detected Chemicals Related to Former Site Activities

To determine whether ND data exceeding SLs could potentially be related to former site activities, the historical IAAAP facility-wide dataset for the non-Formerly Utilized Sites Remedial Action Program (FUSRAP) sites was evaluated, and results are provided in Attachment 4 (Table 2). The ND comparison included historically detected chemicals in all media; however, sediment did not have any DLs or RLs greater than SLs at the WBP, and soil is being addressed under the Operable Unit 1 Remedial Action.

Surface Water

In surface water, one metal (chromium) and one VOC (1,2,3-trichloropropane) have DLs and RLs greater than SLs.

- **ND Metals in Surface Water:** Chromium has been historically detected in all media (groundwater, soil, surface water and sediment) at IAAAP. The maximum chromium DL of 8 ug/L and the maximum RL of 10 ug/L are less than the chromium Maximum Contaminant Level (MCL) of 100 ug/L (USEPA, 2023). Therefore, even if chromium was in surface water at quantities less than the maximum DL or maximum RL, chromium concentrations would be considered acceptable for potable use (although current and future use of site surface water is not designated for potable use).

- **ND VOCs in Surface Water**: 1,2,3-Trichloropropane has not been historically detected in any media (groundwater, soil, surface water or sediment) at IAAAP. Out of 60 ND VOCs in surface water, 1,2,3-trichloropropane was the only ND VOC with DLs and/or RLs greater than SLs. While there were 2 detected surface water VOCs (Freon 113 and 1,1-dichloroethene) in the surface water data set (see Attachment 1, Table 2.1), both VOCs were below SLs. Additionally, the 1,2,3-trichloropropane maximum DL of 0.8 ug/L and maximum RL or 3 ug/L are within acceptable levels for a VOC analysis. Of the 60 analyzed ND VOCs, 1,2,3-trichloropropane has the lowest SL (0.465 ug/L). As a result, the 1,2,3-trichloropropane DLs and RLs greater than SLs are most likely due to the higher toxicity/lower SL associated with 1,2,3-trichloropropane in comparison to the other analyzed VOCs, and it is highly probable 1,2,3-trichloropropane is not present in site groundwater.

Groundwater

In groundwater, 3 explosives (2,4-dinitrotoluene, 2-nitrotoluene and nitrobenzene), one metal (chromium), 3 SVOCs (1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene), and 24 VOCs have RLs and/or DLs exceeding SLs at the WBP.

- **ND Explosives in Groundwater**: 2,4-dinitrotoluene, 2-nitrotoluene and nitrobenzene have been historically detected in groundwater, soil and surface water at IAAAP, but of the 3 explosives, only 2,4-dinitrotoluene and nitrobenzene have been historically detected in sediment at IAAAP. It is noted that DLs (ranging from 0.082 to 0.21 ug/L) and RLs (ranging from 0.1 to 0.42 ug/L) for the 3 explosives with RLs and 1 explosive with DLs greater than SLs are acceptably low for an explosives analysis. Additionally, when compared to the other ND explosives with DLs and RLs less than SLs, the SLs for the 3 ND explosives with DLs and/or RLs greater than SLs also have the lowest SLs for all the ND explosives. As a result, despite having acceptably low DLs and RLs for explosives analysis, it is highly probable that the ND explosives with DLs and RLs greater than SLs are due to the relatively higher toxicity of these 3 explosives in comparison to the other analyzed ND explosives, and it is unlikely any of the ND explosives are present in site groundwater.
- **ND Metals in Groundwater:** Chromium has been historically detected in all media (groundwater, soil, surface water and sediment) at IAAAP. The maximum chromium DL of 8 ug/L and the maximum RL of 10 ug/L are less than the chromium MCL of 100 ug/L (USEPA, 2023). Therefore, even if chromium was in site groundwater at quantities less than the maximum DL or maximum RL, it would not be identified as a chemical of concern (COC) in groundwater.

- **ND SVOCs in Groundwater**: 1,2,4-Trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene have all been historically detected in soil at IAAAP, but only 1,2,4-trichlorobenzene has been historically detected in groundwater at IAAAP, and none of the 3 ND

SVOCs have been historically detected in surface water or sediment at IAAAP. The maximum DLs for 1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobenzene are 80 ug/L, 40 ug/L and 80 ug/L, respectively, and the maximum RLs are 100 ug/L. However, it is noted that for 1,2,4-trichlorobenzene and hexachlorobutadiene, 21 of 25 samples (84%) have a DL of 0.8 ug/L and a RL of 1 ug/L and that for 1,4-dichlorobenzene, 21 of 25 samples (84%) have a DL of 0.4 ug/L and a RL of 1 ug/L. The elevated DLs and RLs for all three ND SVOCs with RLs and/or DLs greater than SLs came from samples WBP-99-2-0319, WBP-TTMW-01-0319, WBP-TTMW-02-0319 and WBP-TTMW-14-0319 (see Attachment 2 [WBP Analytical Data]). It is noted that the locations (WBP-99-2 and WBP-TTMW-01) associated with ND SVOC samples with elevated DLs and RLs are also associated with relatively elevated VOC detections (See Attachment 1, Table 2.3 and Attachment 2). The elevated ND SVOC RLs and DLs are likely the result of chemical interferences from the elevated detected VOC concentrations in WBP-99-2 and WBP-TTMW-01; and as demonstrated by 84% of ND SVOCs with RLs less than 1 ug/L, it is highly unlikely any of the ND SVOCs with RLs and/or DLs greater than SLs are present in site groundwater.

- **ND VOCs in Groundwater**: Twenty-four of the ND VOCs had RLs greater than SLs, and 21 of the ND VOCs had DLs greater than SLs. Of the 24 ND VOCs with DLs and/or RLs greater than SLs, 13 have been historically detected in groundwater at IAAAP, 5 have been historically detected in soil at IAAAP, 7 have been historically detected in surface water at IAAAP, and 2 have been historically detected in sediment at IAAAP. There are 600 analytical results for the combined 24 ND VOCs with DLs and/or RLs greater than SLs (see Attachment 2). The DLs for these 24 ND VOCs range from 0.2 ug/L to 400 ug/L and RLs range from 1 ug/L to 500 ug/L. However, 504 of the 600 analytical results (84%) of the combined 24 ND VOCs with DLs and/or RLs greater than SLs have RLs equal to or less than 5 ug/L and 520 of the 600 analytical results (87%) have DLs of 4 ug/L or less. Additionally, the sample locations with RLs greater than 100 ug/L that are associated with the 24 ND VOCs come from sample locations WBP-99-2, WBP-TTMW-01 and WBP-TTMW-02, which are within the defined boundaries of the WBP VOC plumes and which have confirmed elevated detections of plume-associated VOCs. The elevated ND VOC RLs and DLs are likely the result of chemical interferences from the elevated detected VOC concentrations at WBP-99-2 and WBP-TTMW-01 and WBP-TTMW-02, and as demonstrated by 84% of ND SVOCs with RLs equal to or less than 5 ug/L and 87% of DLs equal to or less than 4 ug/L, it is highly unlikely any of the ND VOCs with RLs and/or DLs greater than SLs are present in site groundwater.

Conclusions

In surface water, one metal (chromium) and one VOC (1,2,3-trichloropropane) have DLs and/or RLs greater than SLs. In groundwater, 3 explosives (2,4-dinitrotoluene, 2-nitrotoluene and nitrobenzene), one metal (chromium), 3 SVOCs (1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene), and 24 VOCs have RLs and/or DLs exceeding SLs at the WBP. Although the DLs and/or RLs for these ND chemicals are greater than the SLs, based on the frequency of exceedance, probable chemical interference from detected VOCs and comparison to historically detected chemicals in groundwater at IAAAP, further consideration of ND chemicals does not appear warranted in the WBP HHRA.

TABLE 1

SELECTION OF EXPOSURE PATHWAYS

North Burn Pads

Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Soil	Soil	Soil	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion, Inhalation	On-site	None	The North Burn Pads is closed to recreational use; therefore, hunting is not permitted at the site. Additionally, soil is addressed under OU1 with land use controls for industrial land use.
	Surface Water/Sediment	Surface Water/Sediment	Spring Creek	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion	On-site	None(1)	There is a very small reach of an unnamed perennial surface water feature within the NBP site boundary. Since it flows into the WBP Area, surface water and sediment are evaluated in the WBP Area HHRA.
Future	Soil	Soil	Soil	Site Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	Soil is addressed under OU1 with land use controls for industrial land use.
				Construction/ Utility Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	
				Hypothetical Resident	Adult, Child	Dermal, Ingestion, Inhalation	On-site	None	
	Groundwater(2)	Tapwater	Tapwater	Site Worker	Adult	Dermal, Ingestion	On-site	Quant (3)	Future site workers could use groundwater as a potable water source. Site workers could ingest drinking water and could have dermal contact with groundwater while hand washing.
				Hypothetical Resident	Adult, Child	Dermal, Ingestion	On-site	Quant	Future hypothetical residents could use groundwater as a potable water source. Residents could ingest drinking water and could have dermal contact with groundwater while showering.
		Household Air (Domestic Use)	Vapors in House (Domestic Use)	Hypothetical Resident	Adult, Child	Inhalation	On-site	Quant	Future hypothetical residents could be exposed to vapors in household air via inhalation.
		Indoor Air (Vapor Intrusion)	Indoor Air (Vapor Intrusion)	Hypothetical Resident	Adult, Child	Inhalation	On-Site	Quant	Future hypothetical residents could inhale volatile groundwater constituents in indoor air from vapor intrusion.
				Site Worker	Adult	Inhalation	On-site	Quant (3)	Site workers could inhale volatile groundwater constituents in indoor air from vapor intrusion.
	Shallow Groundwater	Shallow Groundwater	Shallow Groundwater in Trench	Construction/ Utility Worker	Adult	Dermal, Ingestion	On-site	Quant (3)	Construction/utility workers could incidentally ingest and have dermal contact with shallow groundwater in a trench while replacing the culverts within the North Burn Pads.
		Trench Air	Vapors in a Trench	Construction/ Utility Worker	Adult	Inhalation	On-site	Quant (3)	Construction/utility workers could inhale volatile groundwater constituents in trench air while replacing culverts within the North Burn Pads.

Notes:
Quant: Quantitative evaluation

(1) Surface water and sediment are not evaluated in the North Burn Pads HHRA. Surface water and sediment for the entire Explosives Disposal Area is being evaluated with the West Burn Pad Area HHRA.
(2) Groundwater is not currently being used as a potable water source and there are no plans to use groundwater for potable purposes in the future; however, based on applicable CERCLA policy and guidance, groundwater at the North Burn Pads is classified as Class IIB, a potential source of drinking water. Therefore, the HHRA evaluates potential exposures to groundwater due to its potential future use as a drinking water source. This requires the evaluation of future residential exposures to groundwater.
(3) Potential exposures to groundwater are only estimated for a site worker and construction/utility worker if the estimated risks for a hypothetical residential scenario exceed acceptable risk levels and COCs are identified for a residential scenario.

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Regional Screening Levels (RSL) for Tap Water (May 2023). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for Chromium(VI) was used for Chromium, total.

(4) Values are the Federal Maximum Contaminant Levels (MCLs) and if no MCL was available, the EPA's (March 2018) Office of Water Lifetime Health Advisory (LHA) was provided.

(5) Rationale Codes
Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
ca = carcinogenic
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
MNX = 1-Nitroso-3,5-dinitro-1,3,5-triazacyclohexane
NA = not available
nc = noncarcinogenic
µg/L= microgram per liter

TABLE 2.2
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN
North Burn Pads
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Site Worker and Hypothetical Resident)
Medium: Groundwater
Exposure Medium: Indoor Air (Vapor Intrusion)

Exposure Point	CAS Number	Chemical	Minimum Concentration Qualifier	Maximum Concentration Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3)	Potential ARAR/TBC Value	Potential ARAR/TBC Source	COPC Flag	Rationale for Selection or Deletion (4)
Indoor Air (Vapor Intrusion) North Burn Pads	2691-41-0	HMX	8.8E-02 J	8.8E-02 J	ug/L	JAW-11	1 / 5	0.088 - 0.2	8.8E-02	NA	NSV	NA	NA	No	NSV

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Residential Groundwater Vapor Intrusion Screening Level (May 2023). Concentration based on site specific groundwater temperature of 13°C and non-carcinogenic health effects are based on HQ=0.1.

(4) Rationale Codes:

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)
Not Sufficiently Volatile (NSV)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
MNX = 1-Nitroso-3,5-dinitro-1,3,5-triazacyclohexane
NA = not available
nc = noncarcinogenic
μg/L= microgram per liter

TABLE 2.3
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN
North Burn Pads
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Construction/Utility Worker)
Medium: Shallow Groundwater
Exposure Medium: Shallow Groundwater in a Trench

Exposure Point	CAS Number	Chemical	Minimum Concentration Qualifier		Maximum Concentration Qualifier		Units	Location of Maximum Concentration	Detection Frequency	Range of Detection Limits	Concentration Used for Screening (1)	Background Value (2)	Screening Toxicity Value (3)		Potential ARAR/TBC Value (4)	Potential ARAR/TBC Source (4)	COPC Flag	Rationale for Selection or Deletion (5)
Groundwater	2691-41-0	HMX	8.8E-02	J	8.8E-02	J	ug/L	JAW-11	1 / 2	0.088 - 0.2	8.8E-02	NA	1.0E+02	nc	4.0E+02	LHA	No	BSL
(Shallow Groundwater/Vapors	5755-27-1	MNX	1.0E-01	J	1.0E-01	J	ug/L	NBP-MW1	1 / 2	0.093 - 0.29	1.0E-01	NA	NTX		NA	NA	No	BSL

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Regional Screening Levels (RSL) for Tap Water (May 2023). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.

(4) Values are the Federal Maximum Contaminant Levels (MCLs) and if no MCL was available, the EPA's (March 2018) Office of Water Lifetime Health Advisory (LHA) was provided.

(5) Rationale Codes

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
ca = carcinogenic
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
MNX = 1-Nitroso-3,5-dinitro-1,3,5-triazacyclohexane
NA = not available
nc = noncarcinogenic
μg/L= microgram per liter

TABLE 3.1.RME
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
North Burn Pads
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Site Worker and Hypothetical Resident)
Medium: Groundwater
Exposure Medium: Tapwater

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean*	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Exposure Point Concentration **			
						Value	Units	Statistic	Rationale
Tapwater North Burn Pads	Chromium	µg/L	1.4E+00	NA	2.4E+00 J	2.4E+00	µg/L	Sitewide Max	1
	1,1,2-Trichlorotrifluoroethane (Freon 113)	µg/L	NA	NA	2.0E+03	2.0E+03	µg/L	Sitewide Max	1

Notes:
Statistics: Max - Maximum Detected Value

* Arithmetic mean of detected concentrations are presented.

Rationale:
(1) The maximum detected concentration was used as the EPC because there were less than 4 detected concentrations or less than 8 samples collected.

µg/L = microgram per liter
EPC = Exposure Point Concentration
J = compound was detected below the reporting limit in the sample
NA = Not Available
RME = Reasonable Maximum Exposure
UCL = Upper Confidence Limit

TABLE 3.2.RME
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
North Burn Pads
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Site Worker and Hypothetical Resident)
Medium: Groundwater
Exposure Medium: Indoor Air (Vapor Intrusion)

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean*	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Exposure Point Concentration			
						Value	Units	Statistic	Rationale
Indoor Air (Vapor Intrusion)	1,1,2-Trichlorotrifluoroethane (Freon 113)	µg/L	NA	NA	2.0E+03	2.0E+03	µg/L	Sitewide Max	1

Notes:
Statistics: Max - Maximum Detected Value

* Arithmetic mean of detected concentrations are presented.

(1) The maximum detected concentration was used as the EPC to evaluate the vapor intrusion pathway.

EPC = Exposure Point Concentration
NA = not applicable
UCL = Upper Confidence Limit
µg/L = microgram per liter

TABLE 3.2.RME SUPPLEMENT
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
North Burn Pads
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Site Worker and Hypothetical Resident)

Note:

(1) Source: Risk Assessment Guidance for Superfund. Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Section 4.2 and Exhibit 4-1. USEPA recommends that the oral slope factor should not be adjusted to estimate the absorbed dose for compounds when the absorption efficiency is greater than 50%. Constituents that do not have oral absorption efficiencies reported on this table were assumed to have an oral absorption efficiency of 100%.

(2) Adjusted based on RAGS Part E.

(3) This chemical operates with a mutagenic mode of action (EPA, 2005) and would exhibit a greater effect in early-life versus later-life exposure. Chemical-specific toxicity data are not available for childhood and early-life exposures; thus, EPA (2005) default age-dependent adjustment factors (ADAF) will be applied to the slope factor as follows:

AGE	AGE ADAF
0-<2	10
2-<16	3
16-<26	1

Definitions:
Cal EPA = California Environmental Protection Agency
NA = Not Available

Weight of Evidence definitions (EPA, 1986):
Group A chemicals (known human carcinogens) are agents for which there is sufficient evidence to support the causal association between exposure to the agents in humans and cancer.
Group B2 chemicals (probable human carcinogens) are agents for which there is sufficient evidence of carcinogenicity in animals but inadequate or a lack of evidence in humans.
Group C chemicals (possible human carcinogens) are agents for which there is limited evidence of carcinogenicity in animals and inadequate or a lack of human data.
Group D chemicals (not classifiable as to human carcinogenicity) are agents with inadequate human and animal evidence of carcinogenicity or for which no data are available.

Notes:
(1) The data were reduced such that when a normal and duplicate sample were available, the highest detected concentration among normal or duplicate samples was used when a chemical was detected in any sample. If both results were non-detect, the lowest reported detection limit (i.e., reporting limit) was used.
NA = Not available
WG - groundwater
J - compound was detected below the reporting limit in the sample
= - detected
U - not detected
µg/L - microgram per liter

ATTACHMENT 3

Non-detected Data Analysis: North Burn Pads

Chemicals that were 100 percent non-detected (ND) in a groundwater data grouping were not identified as COPCs for that data grouping; however, a qualitative evaluation of the 100 percent (%) ND chemicals within the North Burn Pads (NBP) groundwater was conducted.

Detection limits (DLs) and reporting limits (RLs) for chemicals that were 100 % ND were compared to groundwater screening levels (SLs). Groundwater SLs are the USEPA Regional Screening levels (RSLs) for tap water (USEPA, 2023) using an excess lifetime cancer risk (ELCR) of 1×10^{-6} and a hazard quotient (HQ) of 1. The NBP ND chemicals and a comparison of the ND DLs and RLs to SLs is provided in Attachment 3, Table 1. ND chemicals exceeding SLs are identified and discussed below with regard to the frequency of exceedance, suitability of the DLs and RLs, and potential to be related to former site activities.

Non-detected Chemicals Exceeding Screening Levels

Four explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene), two metals (arsenic and cadmium), one polycyclic aromatic hydrocarbon ([PAH], naphthalene), 2 semi-volatile organic compounds ([SVOCs] 1,4-dichlorobenzene and hexachlorobutadiene), and 14 volatile organic compounds (VOCs) have RLs and/or DLs exceeding SLs at the NBP. The ND metals dataset did not include RLs. However, 2 explosives (2,4-dinitrotoluene and 2-nitrotoluene), one SVOC (1,4-dichlorobenzene), and 5 VOCs (1,2-dichloropropane, benzene, dibromochloromethane, carbon tetrachloride and trichloroethene) had RLs that were greater than SLs but no DLs greater than SLs. Explosives with RLs and/or DLs greater than SLs had a dataset of 5 samples per explosive, while metals, SVOCs and VOCs with RLs and/or DLs greater than SLs were analyzed in one sample per analyte.

Two explosives (DNX and TNX), 1 SVOC (1,3-dichlorobenzene) and 4 VOCs (1,1-dichloropropene, 1-chlorohexane, 2,2-dichloropropane, and 4-isopropyltoluene) were consistently ND in the NBP data set, but SLs were not available for these ND chemicals. Therefore, those ND chemicals were not included in the ND assessment process.

Non-detected Chemicals Related to Former Site Activities

To determine whether ND chemicals exceeding SLs could potentially be related to former site activities, the historical IAAAP facility-wide dataset for the non-Formerly Utilized Sites Remedial Action Program (FUSRAP) sites was evaluated, and results are provided in Attachment 3, Table 2. The ND comparison included historically detected chemicals in all media; however, surface water and sediment are not being evaluated in the NBP HHRA and soil is being addressed under the Operable Unit 1 Remedial Action.

- **ND Explosives**: 2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene have been historically detected in groundwater, soil and surface water at IAAAP, and with the exception of 2-nitrotoluene, all have been historically detected in sediment at IAAAP.

  It is noted that DLs (maximum and minimum DLs equal to 0.2 ug/L) and RLs (ranging from 0.2 to 0.4 ug/L) for the 4 explosives with DLs and/or RLs greater than SLs are acceptably low for an explosives analysis. Additionally, when compared to the other ND explosives with DLs and RLs less than SLs, the SLs for the 4 ND explosives with DLs and RLs greater than SLs also have the lowest SLs for all the ND explosives. As a result, it is highly probable that the ND explosives with

DLs and/or RLs greater than SLs are due to the relatively higher toxicity of these 4 explosives in comparison to the other analyzed ND explosives, and it is unlikely that any of the ND explosives are present in site groundwater.

- **ND Metals:** Arsenic and cadmium have been historically detected in all media (groundwater, soil, surface water and sediment) at IAAAP. The maximum DL for arsenic is 10 ug/L, which is equivalent to the MCL as reported in the RSL Table (USEPA, 2023). As a result, even if the ND arsenic results were to be assessed in the HHRA, since the maximum DL is equivalent to the MCL, arsenic would not be identified as a constituent of concern (COC) in groundwater. Similarly, the cadmium DL of 5 ug/L for all 6 ND results is equivalent to the MCL of 5 ug/L. As a result, even if the ND cadmium results were to be assessed in the HHRA, since the maximum DL is equivalent to the MCL, cadmium would not be identified as a COC in groundwater.

- **ND PAHs and SVOCs**: The one PAH (naphthalene) with DLs and RLs greater than the SL has been historically detected in groundwater, soil and sediment at IAAAP. The two SVOCs (1,4-dichlorobenzene and hexachlorobutadiene) with DLs and/or RLs greater than SLs have only been historically detected in soil at IAAAP.

  As shown on Attachment 1, Table 2.1, none of the detected chemicals in groundwater at the NBP were PAHs or SVOCs. The maximum DLs for naphthalene, 1,4-dichlorobenzene and hexachlorobutadiene are less than 1 ug/L and the maximum RLs are all equivalent to 1 ug/L, which are acceptably low DLs and RLs for PAH/SVOC analysis, and the 1,4-dichlorobenzene maximum DL is less than the SL. Based on acceptably low RLs and DLs and the fact that no PAHs or SVOCs were detected in the NBP groundwater dataset, it is highly unlikely that naphthalene, 1,4-dichlorobenzene or hexachlorobutadiene are present in site groundwater.

- **ND VOCs**: Of the 14 VOCs with DLs and/or RLs greater than SLs, 9 have been historically detected in groundwater at IAAAP, 4 have been historically detected in soil at IAAAP, 6 have been historically detected in surface water at IAAAP, and one has been historically detected in sediment at IAAAP.

  Although 3 VOCs were detected in the groundwater data set (Attachment 1, Table 2.1), only one VOC was detected above the SL (Freon 113), and the two other detected VOCs (bromomethane and chloroform) that were detected at concentrations less than SLs had relatively low DLs of 0.21 ug/L (bromomethane) and 0.16 ug/L (chloroform). Of the 14 ND VOCs with RLs greater than SLs, the maximum RL was 5 ug/L, with the majority of RLs being 1 ug/L. Of the 9 ND VOCs with DLs greater than SLs, the maximum DL was 1.6 ug/L (1,2-dibromo-3-chloropropane), with the 8 other VOCs having maximum DLs less than 1 ug/L. Despite the relatively elevated detection of Freon 113, there is no indication that the Freon 113 detection caused interference with other VOC DLs or RLs based on the acceptably low DLs and RLs of the other detected VOCs and the ND VOCs. As a result, ND VOCs with DLs and/or RLs greater than SLs is likely the result of the higher toxicity/lower SLs associated with the ND VOCs, and it is highly unlikely that any of the ND VOCs with RLs and/or DLs greater than SLs are present in site groundwater.

Conclusions

Four explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene), two metals (arsenic and cadmium), one PAH (naphthalene), 2 SVOCs (1,4-dichlorobenzene and hexachlorobutadiene), and 14 VOCs have RLs and/or DLs exceeding SLs at the NBP. Although the DLs and/or RLs for these ND chemicals are greater than the SLs, based on acceptably low DLs and RLs, further consideration of ND chemicals does not appear warranted in the NBP HHRA.

Notes:
(1) Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites (May 2023) - Tapwater. Concentrations based on non-carcinogenic health effects are based on HQ=1; carcinogenic effects are based on risk of 1E-06. Available: https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables
1,3-Dichloropropene was used as a surrogate for cis-1,3-Dichloropropene
1,3-Dichloropropene was used as a surrogate for trans-1,3-Dichloropropene
Xylenes, total was used as a surrogate for Xylene, m,p-
[2] The maximum detection limit and reporting limit were compared to the screening level.

FOD = frequency of detect
ug/L = microgram per liter
NA = not available

TABLE 1

SELECTION OF EXPOSURE PATHWAYS

North Burn Pads Landfill

Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Soil	Soil	Soil	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion, Inhalation	On-site	None	The North Burn Pads Landfill is open to recreational use; therefore, hunting is permitted at the site. However, soil is addressed under OU1 with land use controls for industrial land use.
	Surface Water/Sediment	Surface Water/Sediment	Drainage Ditches	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion	On-site	None	The North Burn Pads Landfill is open to recreational use; therefore, hunting is permitted at the site. However, there are no waterbodies within the North Burn Pads Landfill; thus, surface water and sediment were not evaluated in the HHRA.
	Groundwater	Indoor Air (Vapor Intrusion)	Indoor Air (Vapor Intrusion)	Site Worker [1]	Adult	Inhalation	On-site	None	There are no detected volatile organic compounds in groundwater; therefore, this pathway is incomplete.
Future	Soil	Soil	Soil	Site Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	Soil is addressed under OU1 with land use controls for industrial land use.
				Construction/ Utility Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	
				Hypothetical Resident	Adult, Child	Dermal, Ingestion, Inhalation	On-site	None	
	Groundwater[3]	Tapwater	Tapwater	Site Worker	Adult	Dermal, Ingestion	On-site	Quant [2]	Future site workers could use groundwater as a potable water source. Site workers could ingest drinking water and could have dermal contact with groundwater while hand washing.
				Hypothetical Resident	Adult, Child	Dermal, Ingestion	On-site	Quant	Future hypothetical residents could use groundwater as a potable water source. Residents could ingest drinking water and could have dermal contact with groundwater while showering.
		Household Air (Domestic Use)	Vapors in House (Domestic Use)	Hypothetical Resident	Adult, Child	Inhalation	On-site	None	There are no detected volatile organic compounds in groundwater; therefore, this pathway is incomplete.
		Indoor Air (Vapor Intrusion)	Indoor Air (Vapor Intrusion)	Hypothetical Resident	Adult, Child	Inhalation	On-Site	None	There are no detected volatile organic compounds in groundwater; therefore, this pathway is incomplete.
	Shallow Groundwater	Shallow Groundwater	Shallow Groundwater in Trench	Construction/ Utility Worker	Adult	Dermal, Ingestion	On-site	None	There are no culverts within the North Burn Pads Landfill.
		Trench Air	Vapors in a Trench	Construction/ Utility Worker	Adult	Inhalation	On-site	None	There are no culverts within the North Burn Pads Landfill.

Notes:
Quant: Quantitative evaluation

(1) The North Burn Pads Landfill in currently inactive, however, there is a building on site that is in use by staff members as a break room.
(2) Potential exposures to groundwater are only estimated for a site worker if the estimated risks for a hypothetical residential scenario exceed acceptable risk levels and COCs are identified for a residential scenario.
(3) Groundwater is not currently being used as a potable water source and there are no plans to use groundwater for potable purposes in the future; however, based on applicable CERCLA policy and guidance, groundwater at the North Burn Pads Landfill is classified as Class IIB, a potential source of drinking water. Therefore, the HHRA evaluates potential exposures to groundwater due to its potential future use as a drinking water source. This requires the evaluation of future residential exposures to groundwater.

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Regional Screening Levels (RSL) for Tap Water (May 2023). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for Chromium(VI) was used for Chromium, total.
The RSL for Mercuric Chloride was used for Mercury.

(4) Values are the Federal Maximum Contaminant Levels (MCLs) and if no MCL was available, the EPA's (March 2018) Office of Water Lifetime Health Advisory (LHA) was provided.

(5) Rationale Codes
Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)
No Toxicity Value Available (NTX)
Essential Nutrient (NUT)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
B = Inorganic, metals results detected below the RL. The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
ca = carcinogenic
COPC = Chemical of Potential Concern
E = Sample result over the calibration range, considered an estimated result.
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
L = lead action level
MNX = 1-Nitroso-3,5-dinitro-1,3,5-triazacyclohexane
NA = not available
nc = noncarcinogenic
RDX = Royal Demolition Explosive
μg/L= microgram per liter

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Residential Groundwater Vapor Intrusion Screening Level (May 2023). Concentration based on site specific groundwater temperature of 13°C and non-carcinogenic health effects are based on HQ=0.1.

(4) Rationale Codes:

Deletion Reason: Not Sufficiently Volatile (NSV)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
B = Inorganic, metals results detected below the RL. The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
µg/L= microgram per liter
COPC = Chemical of Potential Concern
E = Sample result over the calibration range, considered an estimated result.
HMX = Hot Melt Explosive
HQ = hazard quotient
J = compound was detected below the reporting limit in the sample
MNX = 1-Nitroso-3,5-dinitro-1,3,5-triazacyclohexane
NA = not available
RDX = Royal Demolition Explosive

TABLE 3.1.RME
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
North Burn Pads Landfill
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Hypothetical Resident)
Medium: Groundwater
Exposure Medium: Tapwater

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean*	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Exposure Point Concentration **			
						Value	Units	Statistic	Rationale
Tapwater North Burn Pads Landfill RDX Plume	RDX	µg/L	1.4E+01	NA	1.4E+01	1.4E+01	µg/L	RDX Plume Max	1
	Antimony	µg/L	4.1E+00	NA	4.1E+00 B	4.1E+00	µg/L	Site-wide Max	1
	Cadmium	µg/L	8.0E-01	NA	9.3E-01	9.3E-01	µg/L	Site-wide Max	1
	Chromium	µg/L	2.1E+00	NA	5.2E+00	5.2E+00	µg/L	Site-wide Max	1

Notes:
* Arithmetic mean of detected concentrations are presented.
** Groundwater EPCs for explosives were calculated using monitoring wells located within the core of the RDX plume: NBPLF-MW3 and JAW-627.

Statistics:
Max: Maximum detected value

Rationale:
(1) The maximum detected concentration was used as the EPC because there were less than 4 detected concentrations or less than 8 samples were collected.

Acronyms:
B = Inorganic, metals results detected below the RL. The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
EPC = Exposure Point Concentration
UCL = Upper Confidence Limit
ug/L = microgram per liter

Chromium (hexavalent) (3)	5.0E-01	$(mg/kg\text{-}day)^{-1}$	2.5%	2.0E+01	$(mg/kg\text{-}day)^{-1}$	Cannot determine (oral)	CalEPA	09/18/2023
RDX	8.0E-02	$(mg/kg\text{-}day)^{-1}$	100%	8.0E-02	$(mg/kg\text{-}day)^{-1}$	Suggestive evidence of carcinogenic potential	IRIS	09/18/2023

Note:

(1) Source: Risk Assessment Guidance for Superfund. Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Section 4.2 and Exhibit 4-1. USEPA recommends that the oral slope factor should not be adjusted to estimate the absorbed dose for compounds when the absorption efficiency is greater than 50%. Constituents that do not have oral absorption efficiencies reported on this table were assumed to have an oral absorption efficiency of 100%.

(2) Adjusted based on RAGS Part E.

(3) This chemical operates with a mutagenic mode of action (EPA, 2005) and would exhibit a greater effect in early-life versus later-life exposure. Chemical-specific toxicity data are not available for childhood and early-life exposures; thus, EPA (2005) default age-dependent adjustment factors (ADAF) will be applied to the slope factor as follows:

AGE	AGE ADAF
0-<2	10
2-<16	3
16-<26	1

Definitions:
Cal EPA = California Environmental Protection Agency
IRIS = Integrated Risk Information System
NA = Not Available

Notes:
bgs = below ground surface
CSF = Cancer slope factor
EPC = Exposure point concentration
NA = Not applicable/Not available
RfC = Reference concentration
RfD = Reference dose
µg/L = microgram per liter
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day

TABLE 7.8.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
North Burn Pads Landfill
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq
RDX	1.4E+01	3.4E-04	1.9E-03	1.8E+00	4.4E+00	1.0E+00	0.54	1.3E-08	1

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \leq t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 1)

Notes:
Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.
B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).
cm/hr - centimeter per hour
hr - hour
mg/cm^2-event - milligram per square centimeter per event
µg/L - microgram per liter
NA - Not applicable
t* - Time to reach steady-state
CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

TABLE 7.9.RME

CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS (SITE-RELATED COPCS)

REASONABLE MAXIMUM EXPOSURE

North Burn Pads Landfill

Iowa Army Ammunition Plant, Middletown, Iowa

Notes:

(1) The data were reduced such that when a normal and duplicate sample were available, the highest detected concentration among normal or duplicate samples was used when a chemical was detected in any sample. If both results were non-detect, the lowest reported detection limit (i.e., reporting limit) was used.

NA = Not available

WG - groundwater

J - compound was detected below the reporting limit in the sample

= - detected

U - not detected

µg/L - microgram per liter

ATTACHMENT 3

Non-detected Data Analysis: North Burn Pads Landfill

Chemicals that were 100 percent non-detected (ND) in a data grouping were not identified as COPCs for that data grouping; however, a qualitative evaluation of the 100 percent (%) ND chemicals within North Burn Pads Landfill (NBPLF) groundwater was conducted.

Detection limits (DLs) and reporting limits (RLs) for chemicals that were 100 % ND were compared to groundwater screening levels (SLs). Groundwater SLs are the USEPA Regional Screening levels (RSLs) for tap water (USEPA, 2023) using an excess lifetime cancer risk (ELCR) of $1x10^{-6}$ and a hazard quotient (HQ) of 1. The NBPLF ND chemicals and a comparison of the ND DLs and RLs to SLs is provided in Attachment 3 (Table 1). ND chemicals exceeding SLs are identified and discussed below with regard to the frequency of exceedance and potential to be related to former site activities.

Non-detected Chemicals Exceeding Screening Levels

Four ND explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene) had RLs greater than SLs. However, only 2,6-dinitrotoluene and nitrobenzene had DLs greater than SLs. Three ND metals (arsenic, cobalt and thallium) had DLs greater than SLs. RLs were not available for the ND metals. Explosives with DLs and/or RLs greater than SLs had a dataset of 7 samples per explosive. The ND dataset for arsenic consisted of 5 samples and cobalt and thallium had 1 sample each.

Two explosives (DNX and TNX) were consistently ND in the NBPLF data set, but SLs were not available for these ND chemicals. Therefore, those ND chemicals were not included in the ND assessment process.

Non-detected Chemicals Related to Former Site Activities

To determine whether ND data exceeding SLs could potentially be related to former site activities, the historical IAAAP facility-wide dataset for the non-Formerly Utilized Sites Remedial Action Program (FUSRAP) sites was evaluated, and results are provided in Attachment 3 (Table 2). The ND comparison included historically detected chemicals in all media; however, surface water and sediment are not present at NBPLF and soil is being addressed under the Operable Unit 1 Remedial Action.

- **ND Explosives**: 2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene have been historically detected in groundwater, soil and surface water at IAAAP and, with the exception of 2-nitrotoluene, all have been historically detected in sediment at IAAAP. It is noted that DLs (ranging from 0.1 to 0.21 ug/L) and RLs (ranging from 0.13 to 0.53 ug/L) for the 4 ND explosives with DLs and/or RLs greater than SLs are acceptably low for an explosives analysis. Additionally, when compared to the other ND explosive with DLs and RLs less than SLs, the SLs for the 4 ND explosives with DLs and RLs greater than SLs also have the lowest SLs for all the ND explosives. As a result, having acceptably low DLs and RLs for explosives analysis, it is highly probable that the ND explosives with DLs and RLs greater than SLs are due to the relatively higher toxicity of these 4 explosives in comparison to the other analyzed ND explosives, and it is unlikely that any of the ND explosives are present in site groundwater.

- **ND Metals:** Arsenic, cobalt and thallium have been historically detected in soil, surface water and sediment at IAAAP. However, only arsenic and cobalt have been historically detected in groundwater at IAAAP. Although all 5 arsenic samples had DLs greater than SLs, it is noted with the exception of one DL at 20 ug/L, all other DLs were equal to or less than the arsenic Maximum Contaminant Level (MCL) of 10 ug/L (USEPA, 2023). Based on the majority of the arsenic data set (80%) being equal to or less than the MCL and all arsenic results in the groundwater dataset being 100% ND, it is unlikely that arsenic is present in groundwater at unacceptable concentrations.

DLs available for the ND metals are typical of a USEPA 6010 metals analysis (USEPA, 2014), including the cobalt DL. However, it is noted that, aside from arsenic and thallium, cobalt has a significantly lower SL in comparison to the other ND metals. As a result, the cobalt DL greater than the SL is most likely due to the higher toxicity of cobalt in comparison to the other ND metals that did not have DLs greater than SLs; and it is unlikely that any of the ND metals are present in site groundwater.

The thallium oral RfD of 1×10^{-5} mg/kg-day in the RSL table is a provisional toxicity value presented in an appendix to the main Provisional Peer Reviewed Toxicity Value (PPRTV) document (USEPA, 2012). Due to the lack of availability of suitable human studies noted in the main document, USEPA decided that it was inappropriate to derive a chronic PPRTV for thallium and instead presented the oral RfD value as a screening toxicity value in an appendix. USEPA warns that users of screening toxicity values in an appendix to a PPRTV assessment should understand that there is considerably more uncertainty associated with the derivation of a supplemental screening toxicity value than for a value presented in the body of the PPRTV assessment. Due to the high level of uncertainty associated with this value, potential risks associated with thallium are typically evaluated qualitatively as opposed to calculating numerical risk estimates.

Conclusions

Four explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene), and 3 metals (arsenic, cobalt and thallium) have DLs and/or RLs exceeding SLs at the NBPLF. Although the DLs and/or RLs for these ND chemicals are greater than the SLs, based on the acceptably low DLs, further consideration of ND chemicals does not appear warranted in the NBPLF HHRA.

Historically Detected Chemicals at IAAAP

Iowa Army Ammunition Plant, North Burn Pads Landfill, Middletown, Iowa

100% ND Chemical > SL	Detected in Groundwater	Detected in soil	Detected in Surface Water	Detected in Sediment
2,4-Dinitrotoluene	X	X	X	X
2,6-Dinitrotoluene	X	X	X	X
2-Nitrotoluene	X	X	X	--
Nitrobenzene	X	X	X	X
Arsenic	X	X	X	X
Cobalt	X	X	X	X
Thallium	--	X	X	X

X = chemical was historically detected

-- = chemical was not historically detected.

TABLE 1

SELECTION OF EXPOSURE PATHWAYS

Fire Training Pit

Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	On-Site/ Off-Site	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Soil	Soil	Soil	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion, Inhalation	On-site	None	The Fire Training Pit is open to recreational use; therefore, hunting is permitted at the site. However, soil is addressed under OU1 with land use controls for industrial land use.
	Surface Water/Sediment	Surface Water/Sediment	Drainage Ditches	Hunter/Recreator	Adult, Adolescent	Dermal, Ingestion	On-site	None	The Fire Training Pit is open to recreational use; therefore, hunting is permitted at the site. However, there are no perennial waterbodies present at the site, thus surface water and sediment were not evaluated in the HHRA.
Future	Soil	Soil	Soil	Site Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	Soil is addressed under OU1 with land use controls for industrial land use.
				Construction/ Utility Worker	Adult	Dermal, Ingestion, Inhalation	On-site	None	
				Hypothetical Resident	Adult, Child	Dermal, Ingestion, Inhalation	On-site	None	
	Groundwater(1)	Tapwater	Tapwater	Site Worker	Adult	Dermal, Ingestion	On-site	Quant (2)	Future site workers could use groundwater as a potable water source. Site workers could ingest drinking water and could have dermal contact with groundwater while hand washing.
				Hypothetical Resident	Adult, Child	Dermal, Ingestion	On-site	Quant	Future hypothetical residents could use groundwater as a potable water source. Residents could ingest drinking water and could have dermal contact with groundwater while showering.
		Household Air (Domestic Use)	Vapors in House (Domestic Use)	Hypothetical Resident	Adult, Child	Inhalation	On-site	Quant	Future hypothetical residents could be exposed to vapors in household air via inhalation.
		Indoor Air (Vapor Intrusion)	Indoor Air (Vapor Intrusion)	Hypothetical Resident	Adult, Child	Inhalation	On-Site	Quant	Future hypothetical residents could inhale volatile groundwater constituents in indoor air from vapor intrusion.
				Site Worker	Adult	Inhalation	On-site	Quant (2)	Site workers could inhale volatile groundwater constituents in indoor air from vapor intrusion.
	Shallow Groundwater	Shallow Groundwater	Shallow Groundwater in Trench	Construction/ Utility Worker	Adult	Dermal, Ingestion	On-site	Quant (2)	Construction/utility workers could incidentally ingest and have dermal contact with shallow groundwater in a trench while replacing the culverts within the groundwater plume associated with the Fire Training Pit.
		Trench Air	Vapors in a Trench	Construction/ Utility Worker	Adult	Inhalation	On-site	Quant (2)	Construction/utility workers could inhale volatile groundwater constituents in trench air while replacing culverts within the groudnwater plume associated with the Fire Training Pit.

Notes:
Quant: Quantitative evaluation

(1) Groundwater is not currently being used as a potable water source and there are no plans to use groundwater for potable purposes in the future; however, based on applicable CERCLA policy and guidance, groundwater at the Fire Training Area is classified as Class IIB, a potential source of drinking water. Therefore, the HHRA evaluates potential exposures to groundwater due to its potential future use as a drinking water source. This requires the evaluation of future residential exposures to groundwater.

(2) Potential exposures to groundwater are only estimated for a site worker and construction/utility worker if the estimated risks for a hypothetical residential scenario exceed acceptable risk levels and COCs are identified for a residential scenario.

TABLE 2.1
OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Site Worker and Hypothetical Resident)
Medium: Groundwater
Exposure Medium: Tapwater/Household Air (Domestic Use)

	95-47-6	Xylene, o-	1.4E+01		2.1E+02	µg/L	FTA-TT-MW-03	4 / 24	0.4 - 40	2.1E+02	NA	1.9E+01	nc	NA	NA	Yes	ASL

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa* . Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Regional Screening Levels (RSL) for Tap Water (May 2023). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for m-xylene was used for m,p-xylene.

(4) Values are the Federal Maximum Contaminant Levels (MCLs) and if no MCL was available, the EPA's (March 2018) Office of Water Lifetime Health Advisory (LHA) was provided.

(5) Rationale Codes
Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
ca = carcinogenic
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
NA = not available
nc = noncarcinogenic
RDX = Royal Demolition Explosive
µg/L= microgram per liter

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Residential Groundwater Vapor Intrusion Screening Level (May 2023). Concentration based on site specific groundwater temperature of 13°C and non-carcinogenic health effects are based on HQ=0.1.

(4) Rationale Codes:

Selection Reason: Above Screening Levels (ASL)
Deletion Reason: Below Screening Level (BSL)
Not Sufficiently Volatile (NSV)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
ca = carcinogenic
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
NA = not available
nc = noncarcinogenic
RDX = Royal Demolition Explosive
µg/L= microgram per liter

Notes:

(1) Maximum concentration is used for screening.

(2) Source: *Evaluation of Background Concentrations of Metals in Groundwater, Iowa Army* Ammunition Plant, *Middletown, Iowa*. Prepared for U.S. Army Corps of Engineers Louisville District (CH2M, February 2020).

(3) Regional Screening Levels (RSL) for Tap Water (May 2023). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.

(4) Values are the Federal Maximum Contaminant Levels (MCLs) and if no MCL was available, the EPA's (March 2018) Office of Water Lifetime Health Advisory (LHA) was provided.

(5) Rationale Codes

Selection Reason: Above Screening Levels (ASL)

Deletion Reason: Below Screening Level (BSL)
No Toxicity Information (NTX)

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
ca = carcinogenic
COPC = Chemical of Potential Concern
HQ = hazard quotient
HMX = Hot Melt Explosive
J = compound was detected below the reporting limit in the sample
NA = not available
nc = noncarcinogenic
RDX = Royal Demolition Explosive
µg/L= microgram per liter

TABLE 3.1.RME
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Hypothetical Resident and Site Worker)
Medium: Groundwater (RDX and VOC Plumes)
Exposure Medium: Tapwater

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean*	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Exposure Point Concentration **			
						Value	Units	Statistic	Rationale
	Xylene, m,p-	µg/L	2.1E+02	1.6E+02	5.7E+02	1.6E+02	µg/L	95% KM (t) UCL	4
	Xylene, o-	µg/L	9.2E+01	5.8E+01	2.1E+02	5.8E+01	µg/L	95% KM (t) UCL	4

Notes:
EPA's ProUCL software (June 2016, Version 5.1.002) used to determine distribution of data (normal, lognormal, gamma distribution, or nonparametric) and estimate upper confidence limits (UCLs).
* Arithmetic mean of detected concentrations are presented.
** Groundwater EPCs for explosives were calculated using monitoring wells located within the core of the RDX plume: FTA-TT-MW-01, FTA-TT-MW-02, FTA-TT-MW-03, FTA-TT-MW-04, and SA-99-1.
Groundwater EPCs for VOCs were calculated using monitoring wells located within the core of the VOC plume: FTA-TT-MW-01, FTA-TT-MW-02, FTA-TT-MW-03, FTA-TT-MW-04, FTA-TT-MW-05, FTP-MW4, FTP-MW5, FTP-MW6, JAW-58, JAW-59, JAW-60, JAW-61, JAW-80, and SA-99-1. For arsenic and barium, the maximum detected concentration from the core of the RDX plume and VOC plume was used as the EPC.

Statistics:
KM Bootstrap t UCL: UCL based on Kaplan-Meier estimates using the boostrap method
KM (Chebyshev): UCL based on Kaplan-Meier estimates using the Chebyshev inequality
KM (t): UCL based on Kaplan-Meier estimates using the Student's t-distribution critical value

Rationale:
(1) Shapiro-Wilk W/Lilliefors Test indicates data are log-normally distributed.
(2) Shapiro-Wilk W/Lilliefors Test indicates data are normally distributed.
(3) Anderson-Darling and/or Kolmogorov-Smirnov Tests indicate data are gamma distributed.
(4) Distribution tests are inconclusive; therefore, the nonparametric UCL was used as the EPC.
(5) The maximum detected concentration was used as the EPC because there were less than 4 detected concentrations or less than 8 samples were collected.
(6) The maximum detected concentration was used as the EPC because the UCL exceeds the maximum.

Acronyms:
EPC = Exposure Point Concentration
G = Gamma distribution
J = chemical was detected below the reporting limit in the sample
NA = not applicable or not available
UCL = Upper Confidence Limit
ug/L = microgram per liter

	Xylene, o-	2.1E+02	µg/L	2.2E+01	µg/m^3

Notes:
(1) Chemicals of Potential Concern from Table 2.2.RME.
(2) Selection of exposure point concentration from Table 3.2.RME.
(3) The indoor air concentrations for groundwater-to-indoor air were estimated using the EPA's VISL Calculator, May 2023.
Site-specific groundwater temperature of 13 degrees C used to estimate indoor air concentrations.

µg/L = microgram per liter
µg/m^3 = microgram per cubic meter

TABLE 3.3.RME
MEDIUM-SPECIFIC EXPOSURE POINT CONCENTRATION SUMMARY
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future (Construction/Utility Worker)
Medium: Shallow Groundwater (RDX and VOC Plumes)
Exposure Medium: Shallow Groundwater in a Trench

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean*	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Exposure Point Concentration **			
						Value	Units	Statistic	Rationale
	Xylene, m,p-	µg/L	1.3E+02	2.7E+02	5.7E+02	2.7E+02	µg/L	RDX Plume Max	5
	Xylene, o-	µg/L	4.1E+01	8.9E+01	2.1E+02	8.9E+01	µg/L	95% KM (t) UCL	4

Notes:
EPA's ProUCL software (June 2022, Version 5.2) used to determine distribution of data (normal, lognormal, gamma distribution, or nonparametric) and estimate upper confidence limits (UCLs).
* Arithmetic mean of detected concentrations are presented.
** Groundwater EPCs for explosives were calculated using monitoring wells located within the core of the RDX plume: FTA-TT-MW-01, FTA-TT-MW-02, FTA-TT-MW-04, and SA-99-1.
Groundwater EPCs for VOCs were calculated using monitoring wells located within the core of the VOC plume: FTA-TT-MW-01, FTA-TT-MW-02, FTA-TT-MW-03, FTA-TT-MW-04, FTA-TT-MW-05, JAW-58, JAW-61, JAW-80, and SA-99-1.

Statistics:
Gamma Adjusted KM-UCL: UCL based on Kaplan-Meier estimates adjusted assuming gamma distribution
KM Bootstrap t UCL: UCL based on Kaplan-Meier estimates using the boostrap method
KM (Chebyshev): UCL based on Kaplan-Meier estimates using the Chebyshev inequality
KM (t): UCL based on Kaplan-Meier estimates using the Student's t-distribution critical value

Rationale:
(1) Shapiro-Wilk W/Lilliefors Test indicates data are log-normally distributed.
(2) Shapiro-Wilk W/Lilliefors Test indicates data are normally distributed.
(3) Anderson-Darling and/or Kolmogorov-Smirnov Tests indicate data are gamma distributed.
(4) Distribution tests are inconclusive; therefore, the nonparametric UCL was used as the EPC.
(5) The maximum detected concentration was used as the EPC because there were less than 4 detected concentrations or less than 8 samples were collected.
(6) The maximum detected concentration was used as the EPC because the UCL exceeds the maximum.

Acronyms:
EPC = Exposure Point Concentration
G = Gamma distribution
J = chemical was detected below the reporting limit in the sample
NA = not applicable or not available
UCL = Upper Confidence Limit
ug/L = microgram per liter

(1) Site-specific.

VDEQ. Virginia Unified Risk Assessment Model. Appendix 3 Construction Worker Groundwater Trench Model. 2018.

$C_{trench} = C_{GW} \times VF$

C_{trench} = concentration of contaminant in the trench (ug/m^3)

C_{GW} = concentration of contaminant in groundwater (ug/L)

VF = volatilization factor (L/m^3)

TABLE 3.3 RME SUPPLEMENT

Calculation of Constituent Concentrations in Air from Trench Water Using VDEQ Model

Fire Training Pit

Iowa Army Ammunition Plant, Middletown, Iowa

For Mass-Transfer Coefficients

Kg,H_2O	0.833	cm/s
MWH_2O	18	
Kl,O_2	0.002	cm/s
MWO_2	32	
T	**70**	F
T	294	K
R	8.20E-05	atm-m^3/mol-K

For Emission Flux and Concentration in Trench

CF1	1.00E-03	L/cm^3
CF2	1.00E+04	cm^2/m^2
CF3	3600	s/hr
F	**1**	
ACH	2	hr^{-1}

Trench dimensions

Length	**8**	ft
	2.44	m
Width	**2.99**	ft
	0.91	m
Depth	**8**	ft
	2.44	m
Width/Depth	0.37	

VF = (K_i x A x F x 10^{-3} x 10^4 x 3600) / (ACH x V)

K_i = overall mass transfer coefficient of contaminant (cm/sec)

A = area of trench (m^2)

F = fraction of floor through which contaminant can enter (unitless)

ACH = air changes per hour (h^{-1})

V = volume of trench (m^3)

10^{-3} = conversion factor (L/cm^3)

10^4 = conversion factor (cm^2/m^2)

3600 = conversion factor (sec/hr)

Ki = 1 / {(1/kiL) + [(R T) / (Hi k_{iG})]}

kiL = liquid-phase mass transfer coefficient of i (cm/sec)

R = ideal gas constant (8.2 x 10^{-5} atm-m^3/mole-K)

T = average system Fahrenheit (F); average site groundwater temperature (68 F or 20 Celsius).

T = average system absolute temperature (298 K)

Hi = Henry's Law constant of i (atm-m^3/mol) from EPA Regional Screening Levels tables (May 2023)

k_{ig} = gas-phase mass transfer coefficient of i (cm/sec)

kiL = (MWO_2/MWi)0.5 x (T/298) x kL,O_2 (cm/sec)

MWO_2 = molecular weight of O_2 (g/mol)

MWi = molecular weight of component i (g/mol)

kL, O_2 = liquid-phase mass transfer coefficient of oxygen at 25oC (0.002 cm/sec)

k_{iG} = (MWH_2O/MWi)0.335 x (T/298)1.005 x kG, H_2O (cm/s)

MWH_2O = molecular weight of water (g/mol)

k_g, H_2O = gas-phase mass transfer coefficient of water vapor at 25oC (0.833 cm/sec)

CANCER TOXICITY DATA -- ORAL/DERMAL

Fire Training Pit

Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Oral Cancer Slope Factor		Oral Absorption Efficiency for Dermal (1)	Absorbed Cancer Slope Factor for Dermal (2)		Weight of Evidence/ Cancer Guideline Description	Oral CSF	
	Value	Units		Value	Units		Source(s)	Date(s) (MM/DD/YYYY)

(1) Source: Risk Assessment Guidance for Superfund. Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. Section 4.2 and Exhibit 4-1. USEPA recommends that the oral slope factor should not be adjusted to estimate the absorbed dose for compounds when the absorption efficiency is greater than 50%. Constituents that do not have oral absorption efficiencies reported on this table were assumed to have an oral absorption efficiency of 100%.

(2) Adjusted based on RAGS Part E.

(3) This chemical operates with a mutagenic mode of action (EPA, 2005) and would exhibit a greater effect in early-life versus later-life exposure. With the exception of vinyl chloride, chemical-specific toxicity data are not available for childhood and early-life exposures; thus, EPA (2005) default age-dependent adjustment factors (ADAF) will be applied to the slope factor as follows:

AGE	AGE ADAF
0-<2	10
2-<16	3
16-<26	1

Definitions:
Cal EPA = California Environmental Protection Agency
IRIS = Integrated Risk Information System
NA = Not Available

Weight of Evidence definitions (EPA, 1986):

Group A chemicals (known human carcinogens) are agents for which there is sufficient evidence to support the causal association between exposure to the agents in humans and cancer.

Group B2 chemicals (probable human carcinogens) are agents for which there is sufficient evidence of carcinogenicity in animals but inadequate or a lack of evidence in humans.

Group C chemicals (possible human carcinogens) are agents for which there is limited evidence of carcinogenicity in animals and inadequate or a lack of human data.

Group D chemicals (not classifiable as to human carcinogenicity) are agents with inadequate human and animal evidence of carcinogenicity or for which no data are available.

Trichloroethene (NHL + Liver)	3.1E-06	$(ug/m^3)^{-1}$	Carcinogenic to humans	IRIS	09/18/2023
Vinyl Chloride (Adulthood) (1)	4.4E-06	$(ug/m^3)^{-1}$	A	IRIS	09/18/2023
Vinyl Chloride (From Birth) (1)	8.8E-06	$(ug/m^3)^{-1}$	A	IRIS	09/18/2023
Xylene, m,p-	NA	NA	NA	NA	NA
Xylene, o-	NA	NA	NA	NA	NA

Note:

(1) This chemical operates with a mutagenic mode of action (EPA, 2005) and would exhibit a greater effect in early-life versus later-life exposure. With the exception of vinyl chloride, chemical-specific toxicity data are not available for childhood and early-life exposures; 2005); thus, EPA (default age-dependent adjustment factors (ADAF) will be applied to the slope factor as follows:

AGE	AGE ADAF
0-<2	10
2-<16	3
16-<26	1

Definitions: Cal EPA = California Environmental Protection Agency
IRIS = Integrated Risk Information System
NA = Not Available

TABLE 7.1.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Inorganics: DAevent (mg/cm^2-event) =

DA_{event} = Kp x CW x tevent x 0.001 mg/ug x 0.001 l/cm^3 (Eq 1)

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \le t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 2)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =
FA x Kp x CW x (t_{event}/(1+B) + 2 x τ x ((1 + 3B + $3B^2$)/$(1+B)^2$)) xCF1 x CF2 (Eq 3)

Notes:

Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.

B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).

cm/hr - centimeter per hour

hr - hour

mg/cm^2-event - milligram per square centimeter per event

µg/L - microgram per liter

NA - Not applicable

t* - Time to reach steady-state

CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

Inorganics: DAevent (mg/cm^2-event) =

DA_{event} = Kp x CW x tevent x 0.001 mg/ug x 0.001 l/cm^3 (Eq 1)

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \leq t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 2)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =
FA x Kp x CW x (t_{event}/(1+B) + 2 x τ x ((1 + 3B + $3B^2$)/$(1+B)^2$)) xCF1 x CF2 (Eq 3)

TABLE 7.2.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Notes:
Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.
B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).
cm/hr - centimeter per hour
hr - hour
mg/cm^2-event - milligram per square centimeter per event
µg/L - microgram per liter
NA - Not applicable
t* - Time to reach steady-state
CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

				Trichloroethene (NHL + Liver)	2.7E+01	µg/L	4.8E-03	mg/m^3	3.1E-06	1/(µg/m3)	1E-05
			Exp. Route Total								3E-05

Notes:

(1) Carcinogenic risks were estimated for trichloroethene by summing the risks for two different approaches: 1) Using the oral CSF factor for kidney cancer, which has a mutagenic mode of action (calculated in Table 7.3 RME Supplement A), and 2) using the CSF for non-Hodgkin lymphoma (NHL) and liver cancer.

(2) Intakes and exposure concentrations using the toxicity values for the kidney component of TCE were estimated on Table 7.3 RME Supplement A.

CSF = Cancer slope factor

µg/L = microgram per liter

mg/m^3= milligram per cubic meter

mg/kg/day = milligram per kilogram per day

TABLE 7.4.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Inorganics: DAevent (mg/cm^2-event) =

DA_{event} = Kp x CW x tevent x 0.001 mg/ug x 0.001 l/cm^3 (Eq 1)

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \leq t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 2)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =
FA x Kp x CW x (t_{event}/(1+B) + 2 x τ x ((1 + 3B + $3B^2$)/$(1+B)^2$)) xCF1 x CF2 (Eq 3)

Notes:
Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.
B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).
cm/hr - centimeter per hour
hr - hour
mg/cm^2-event - milligram per square centimeter per event
µg/L - microgram per liter
NA - Not applicable
t* - Time to reach steady-state
CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS (SITE-RELATED COPCS)

REASONABLE MAXIMUM EXPOSURE

Fire Training Pit

Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future

Receptor Population: Construction/Utility Worker

Receptor Age: Adult

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations					Non-Cancer Hazard Calculations				
					Value	Units	Intake/Exposure Concentration		CSF/Unit Risk		Cancer Risk	Intake/Exposure Concentration		RfD/RfC		Hazard Quotient
							Value	Units	Value	Units		Value	Units	Value	Units	

Notes:

bgs = below ground surface

CSF = Cancer slope factor

EPC = Exposure point concentration

NA = Not applicable/Not available

RfC = Reference concentration

RfD = Reference dose

µg/L = microgram per liter

µg/m^3= microgram per cubic meter

mg/m^3= milligram per cubic meter

mg/kg = milligram per kilogram

mg/kg/day = milligram per kilogram per day

TABLE 7.5.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \leq t^*$: DA_{event} (mg/cm^2-event) =

$2 \times FA \times Kp \times Cw \times (sqrt((6 \times \tau \times t_{event}) / (3.1415))) \times CF1 \times CF2$ (Eq 1)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =

$FA \times Kp \times CW \times (t_{event}/(1+B) + 2 \times \tau \times ((1 + 3B + 3B^2)/(1+B)^2)) \times CF1 \times CF2$ (Eq 2)

Notes:

Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.

B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).

cm/hr - centimeter per hour

hr - hour

mg/cm^2-event - milligram per square centimeter per event

µg/L - microgram per liter

NA - Not applicable

t* - Time to reach steady-state

CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

bgs = below ground surface
CSF = Cancer slope factor
EPC = Exposure point concentration
NA = Not applicable/Not available
RfC = Reference concentration
RfD = Reference dose
µg/L = microgram per liter
µg/m^3= microgram per cubic meter
mg/m^3= milligram per cubic meter
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day

TABLE 7.6.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Inorganics: DAevent (mg/cm^2-event) =

DA_{event} = Kp x CW x tevent x 0.001 mg/ug x 0.001 l/cm^3 (Eq 1)

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \le t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 2)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =
FA x Kp x CW x (t_{event}/(1+B) + 2 x τ x ((1 + 3B + $3B^2$)/$(1+B)^2$)) xCF1 x CF2 (Eq 3)

Notes:
Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.
B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).
cm/hr - centimeter per hour
hr - hour
mg/cm^2-event - milligram per square centimeter per event
µg/L - microgram per liter
NA - Not applicable
t* - Time to reach steady-state
CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

CALCULATION OF CHEMICAL CANCER RISKS AND NON-CANCER HAZARDS (SITE-RELATED COPCS)

REASONABLE MAXIMUM EXPOSURE

Fire Training Pit

Iowa Army Ammunition Plant, Middletown, Iowa

Scenario Timeframe: Future
Receptor Population: Resident
Receptor Age: Child

Medium	Exposure Medium	Exposure Point	Exposure Route	Chemical of Potential Concern	EPC		Cancer Risk Calculations					Non-Cancer Hazard Calculations				
					Value	Units	Intake/Exposure Concentration		CSF/Unit Risk		Cancer Risk	Intake/Exposure Concentration		RfD/RfC		Hazard Quotient
							Value	Units	Value	Units		Value	Units	Value	Units	

Notes:
bgs = below ground surface
CSF = Cancer slope factor
EPC = Exposure point concentration
NA = Not applicable/Not available
RfC = Reference concentration
RfD = Reference dose
µg/L = microgram per liter
µg/m^3= microgram per cubic meter
mg/m^3= milligram per cubic meter
mg/kg = milligram per kilogram
mg/kg/day = milligram per kilogram per day

TABLE 7.7.RME SUPPLEMENT
CALCULATION OF DAEVENT
REASONABLE MAXIMUM EXPOSURE
Fire Training Pit
Iowa Army Ammunition Plant, Middletown, Iowa

Chemical of Potential Concern	Groundwater Concentration (CW) (ug/L)	Permeability Coefficient (Kp) (cm/hr)	B (dimensionless)	Lag Time (τ_{event}) (hr)	t* (hr)	Fraction Absorbed Water (FA) (dimensionless)	Duration of Event (tevent) (hr)	DAevent (mg/cm^2-event)	Eq

Inorganics: DAevent (mg/cm^2-event) =

DA_{event} = Kp x CW x tevent x 0.001 mg/ug x 0.001 l/cm^3 (Eq 1)

Organics: DAevent (mg/cm^2-event) =

DA_{event} = $t_{event} \leq t^*$: DA_{event} (mg/cm^2-event) =
2 x FA x Kp x Cw x (sqrt((6 x τ x t_{event}) / (3.1415))) x CF1 x CF2 (Eq 2)

$t_{event} > t^*$: DA_{event} (mg/cm^2-event) =
FA x Kp x CW x (t_{event}/(1+B) + 2 x τ x ((1 + 3B + $3B^2$)/$(1+B)^2$)) xCF1 x CF2 (Eq 3)

Notes:
Values for permeability constants, B, tau, t*, and FA are from EPA 2004, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment - Final).* EPA/540/R/99/005.
B - Dimensionless ratio of the permeability coefficient of a compound through the stratum corneum relative to its permeability coefficient across the viable epidermis (dimensionless).
cm/hr - centimeter per hour
hr - hour
mg/cm^2-event - milligram per square centimeter per event
µg/L - microgram per liter
NA - Not applicable
t* - Time to reach steady-state
CF1 - Conversion Factor 1 (0.001 mg/µg), CF2 - Conversion Factor 2 (0.001 L/cm^3)

				Trichloroethene (NHL + Liver)	2.7E+01	µg/L	4.8E-03	mg/m^3	3.1E-06	1/(µg/m3)	1E-05
			Exp. Route Total								3E-05

Notes:

(1) Carcinogenic risks were estimated for trichloroethene by summing the risks for two different approaches: 1) Using the oral CSF factor for kidney cancer, which has a mutagenic mode of action (calculated in Table 7.7 RME Supplement A), and 2) using the CSF for non-Hodgkin lymphoma (NHL) and liver cancer.

(2) Intakes and exposure concentrations using the toxicity values for the kidney component of TCE were estimated on Table 7.7 RME Supplement A.

CSF = Cancer slope factor

µg/L = microgram per liter

mg/m^3= milligram per cubic meter

mg/kg/day = milligram per kilogram per day

Notes:
(1) The data were reduced such that when a normal and duplicate sample were available, the highest detected concentration among normal or duplicate samples was used when a chemical was detected in any sample. If both results were non-detect, the lowest reported detection limit (i.e., reporting limit) was used.
NA = Not available
WG - groundwater
J - compound was detected below the reporting limit in the sample
= - detected
U - not detected
µg/L - microgram per liter

UCL Statistics for Data Sets with Non-Detects

1,1,1-Trichloroethane

General Statistics

Total Number of Observations	9	Number of Distinct Observations	8
Number of Detects	6	Number of Non-Detects	3
Number of Distinct Detects	6	Number of Distinct Non-Detects	2
Minimum Detect	0.24	Minimum Non-Detect	0.4
Maximum Detect	2000	Maximum Non-Detect	16
Variance Detects	653746	Percent Non-Detects	33.33%
Mean Detects	351	SD Detects	808.5
Median Detects	8.6	CV Detects	2.304
Skewness Detects	2.44	Kurtosis Detects	5.963
Mean of Logged Detects	2.374	SD of Logged Detects	3.339

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.526	Shapiro Wilk GOF Test
5% Shapiro Wilk Critical Value	0.788	Detected Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.461	Lilliefors GOF Test
5% Lilliefors Critical Value	0.325	Detected Data Not Normal at 5% Significance Level

Detected Data Not Normal at 5% Significance Level

Kaplan-Meier (KM) Statistics using Normal Critical Values and other Nonparametric UCLs

nu hat (MLE)	2.514	nu star (bias corrected)	2.591
Mean (detects)	351		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	234
Maximum	2000	Median	0.5
SD	662.9	CV	2.833
k hat (MLE)	0.143	k star (bias corrected MLE)	0.169

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Warning: Data set has only 3 Detected Values.

This is not enough to compute meaningful or reliable statistics and estimates.

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Number of Detects	4	Number of Non-Detects	5
Number of Distinct Detects	4	Number of Distinct Non-Detects	1
Minimum Detect	14	Minimum Non-Detect	0.4
Maximum Detect	210	Maximum Non-Detect	0.4
Variance Detects	7044	Percent Non-Detects	55.56%
Mean Detects	92.25	SD Detects	83.93
Median Detects	72.5	CV Detects	0.91
Skewness Detects	1.259	Kurtosis Detects	2.015
Mean of Logged Detects	4.13	SD of Logged Detects	1.127

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Suggested UCL to Use

95% KM Bootstrap t UCL	8324	a Adjusted KM-UCL (use when k<=1 and 15 < n < 50 but k<=1)	3355

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

ATTACHMENT 4

Non-detected Data Analysis: Fire Training Pit

Chemicals that were 100 percent (%) non-detected (ND) in a data grouping were not identified as COPCs for that data grouping; however, a qualitative evaluation of the 100 % ND chemicals within the Fire Training Pit (FTP) media was conducted. For this HHRA, the FTP media consisted of groundwater only.

Detection limits (DLs) and reporting limits (RLs) for chemicals that were 100 % ND were compared to groundwater screening levels (SLs). Groundwater SLs are the USEPA Regional Screening levels (RSLs) for tap water (USEPA, 2023) using an excess lifetime cancer risk (ELCR) of $1x10^{-6}$ and a hazard quotient (HQ) of 1. The FTP ND chemicals and a comparison of the ND DLs and RLs to SLs is provided in Attachment 4 (Table 1). ND chemicals exceeding SLs are identified and discussed below with regard to the frequency of exceedance and potential to be related to former site activities.

Non-detected Chemicals Exceeding Screening Levels

Four explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene), three metals (cadmium, chromium and mercury), 3 semi-volatile organic compounds ([SVOCs] 1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene), and 21 volatile organic compounds (VOCs) have RLs or DLs exceeding SLs at the FTP. Two ND explosives (2,4-dinitrotoluene and 2-nitrotoluene) and 4 ND VOCs (bromobenzene, bromochloromethane, chloromethane and chlorobenzene) had RLs that were greater than SLs but no DLs greater than SLs. ND explosives with RLs and/or DLs greater than SLs had a dataset of 10 samples per explosive. ND metals with RLs and/or DLs greater than SLs had a dataset of 13 samples per metal. ND SVOCs and VOCs with RLs and/or DLs greater than SLs had a dataset of 24 samples per analyte.

Three explosives (DNX, MNX and TNX), one SVOC (1,3-dichlorobenzene) and 3 VOCs (1,1-dichloropropene, 1-chlorohexane and 2,2-dichloropropane) were consistently ND in the FTP data set, but SLs were not available for these ND chemicals. Therefore, these ND chemicals were not included in the ND assessment process.

Non-detected Chemicals Related to Former Site Activities

To determine whether ND data exceeding SLs could potentially be related to former site activities, the historical IAAAP facility-wide dataset for the non-Formerly Utilized Sites Remedial Action Program (FUSRAP) sites was evaluated, and results are provided in Attachment 4 (Table 2). The ND comparison included historically detected chemicals in all media; however, surface water and sediment are not an issue/present at the FTP and soil is being addressed under the Operable Unit 1 Remedial Action.

- **ND Explosives**: 2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene have been historically detected in groundwater, soil and surface water at IAAAP and, with the exception of 2-nitrotoluene, all have been historically detected in sediment at IAAAP. It is noted that DLs (ranging from 0.19 to 0.21 ug/L) and RLs (ranging from 0.19 to 0.42 ug/L) for the 4 explosives with RLs and 2 explosives with DLs greater than SLs are acceptably low for an explosives analysis. Additionally, when compared to the other ND explosives with DLs and RLs less than SLs, the SLs for the 4 ND explosives with DLs or RLs greater than SLs also have the lowest SLs for all the ND explosives. As a result, it is unlikely that any of the ND explosives are present in site groundwater.

- **ND Metals:** Cadmium, chromium and mercury have been historically detected in all media (groundwater, soil, surface water and sediment) at IAAAP.

One cadmium DL and one cadmium RL of the 13 available ground water samples were greater than the RSL. However, he maximum DL (2 ug/L) and maximum RL (2.5 ug/L) are less than the cadmium MCL of 5 ug/L. Therefore, even if cadmium were present in site groundwater at concentrations equivalent to the maxim RL, it would not be identified as a constituent of concern (COC). At the FTP, total chromium concentrations were conservatively assumed to be in the hexavalent form, and the hexavalent chromium SL was exceeded in all samples. However, the maximum total chromium DL of 40 ug/L and the maximum RL of 50 ug/L are less than the total chromium MCL of 100 ug/L. Therefore, even if chromium was present in site groundwater at concentrations at the maximum DL or maximum RL, chromium would still not be identified as a COC. Of the 13 groundwater samples available for mercury, only one sample had a DL (0.75 ug/L) and RL (1 ug/L) marginally greater than the SL of 0.63 ug/L. Based upon the low DLs and RLs available in the mercury groundwater dataset, and the fact that mercury was 100% ND with 90% of the dataset having DLs and RLs less than the SL, it is highly unlikely that mercury is present in site groundwater.

- **ND SVOCs**: 1,2,4-Trichlorobenzene, 1,4-dichlorobenzene and hexachlorobutadiene have all been historically detected in soil at IAAAP, but only 1,2,4-trichlorobenzene has been historically detected in groundwater at IAAAP, and none of the 3 ND SVOCs have been historically detected in surface water or sediment at IAAAP.

  The maximum DLs for 1,2,4-trichlorobenzene, 1,4-dichlorobenzene and hexachlorobenzene are 80 ug/L, 40 ug/L and 80 ug/L, respectively, while the maximum RLs for all three chemicals are 100 ug/L. However, it is noted that for 1,2,4-trichlorobenzene and hexachlorobutadiene, 21 of 24 samples (88%) have a DL of 0.8 ug/L and a RL of 1 ug/L and that for 1,4-dichlorobenzene, 21 of 24 samples (88%) have a DL of 0.4 ug/L and a RL of 1 ug/L. The elevated DLs and RLs for these three ND SVOCs came from samples FTA-TT-MW-02-0319, FTA-TT-MW-03-0319 and SA-99-1-0319 (see Attachment 2 [FTP Analytical Data]). The locations (FTA-TT-MW-02, FTA-TT-MW-03 and SA-99-1) associated with ND SVOC samples with elevated DLs and RLs are also associated with relatively elevated VOC detections (See Attachment 1, Table 2.1 and Attachment 2). The elevated ND SVOC RLs and DLs are likely the result of chemical interferences from the elevated detected VOC concentrations at these three locations, and as demonstrated by 88% of ND SVOCs with RLs less than 1 ug/L, it is unlikely that any of the ND SVOCs with RLs and/or DLs greater than SLs are present in site groundwater.

- **ND VOCs**: Of the 21 ND VOCs with RLs and/or DLs greater than SLs, 9 have been historically detected in groundwater at IAAAP, 4 have been historically detected in soil at IAAAP, 5 have been historically detected in surface water at IAAAP, and one has been historically detected in sediment at IAAAP.

  Twenty-one of the ND VOCs had RLs greater than SLs, and 17 of the ND VOCs had DLs greater than SLs. There are 504 analytical results for the combined 21 ND VOCs with RLs and/or DLs greater than SLs (see Attachment 2). The DLs for these 21 ND VOCs range from 0.2 ug/L to 400 ug/L and RLs range from 1 ug/L to 500 ug/L. However, 441 of the 504 analytical results (88%) have RLs less than or equal to 5 ug/L and 452 of the 504 analytical results (90%) have DLs of 4 ug/L or less. Additionally, the sample locations with RLs greater than 5 ug/L are FTA-TT-MW-02, FTA-TT-MW-03 and SA-99-1. As indicated in Attachment 1, Table 2.1, the majority of the maximum detected VOC concentrations (18 of 21 maximum detects [86%]) came from FTA-TT-MW-02 or FTA-TT-MW-03, and as shown in Attachment 2 (FTP Analytical Data), for many of the detected VOCs, there were significant concentrations reported at SA-99-1. The elevated ND VOC RLs and DLs are likely the result of chemical interferences from the elevated detected VOC concentrations at these three locations, and as demonstrated by 88% of the ND results with RLs less than or equal to 5 ug/L and 90% of DLs less than or equal to 4 ug/L, it is unlikely that any of the ND VOCs with RLs and/or DLs greater than SLs are present in site groundwater.

Conclusions

Four explosives (2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-nitrotoluene and nitrobenzene), three metals (cadmium, chromium and mercury), 3 SVOCs, and 21 VOCs have RLs or DLs exceeding SLs at the FTP. Although the maximum DLs and/or RLs for these ND chemicals are greater than the SLs, based on the frequency of exceedance, comparison to historically detected chemicals in groundwater at IAAAP, and acceptably low DLs and RLs for most samples, further consideration of ND chemicals does not appear warranted in the FTP HHRA.

Appendix B
Data Quality Evaluations

Data Quality Evaluation Report

This report contains the Data Quality Evaluation for sediment and water samples collected April 20, 2018, through July 11, 2019, as part of the Remedial Investigation at the Iowa Army Ammunition Plant, Middletown, Iowa. The report evaluates whether the analytical data obtained in the investigation are of sufficient quality and quantity to accomplish the project objectives.

Abbreviations and Acronyms

DL	detection limit
FD	field duplicate
LCS	laboratory control sample
LOD	limit of detection
LOQ	limit of quantitation
MS/MSD	matrix spike/matrix spike duplicate
PARCC	precision, accuracy, representativeness, completeness and comparability
PCB	polychlorinated biphenyl
QAPP	*Remedial Investigation at Iowa Army Ammunitions Plan, Middletown, Iowa* (CH2M 2017)
QC	quality control
RPD	relative percent difference
SDG	sample delivery group
SVOC	semivolatile organic compounds
TA	TestAmerica Laboratory
USEPA	U.S. Environmental Protection Agency
VOC	volatile organic compounds

1.0 Introduction

This Data Quality Evaluation Report contains an assessment of the quality and usability of analytical data from groundwater and soil samples collected at the Iowa Army Ammunition Plant, Middletown, Iowa project site.

The analytical work was conducted in accordance with the project-specific quality assurance project plan, Remedial Investigation at the Iowa Army Ammunition Plant, Middletown, Iowa (QAPP) (CH2M 2017).

The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC) as described in the QAPP. This report is intended as a general data quality assessment designed to summarize data issues.

1.1 Analytical Laboratories and Analytical Methods

The samples were collected and shipped via overnight carrier for the majority of the analyses to TestAmerica (TA) Laboratories at Arvada, Colorado; Sacramento, California and/or St. Louis, Missouri. Samples collected for hexavalent chromium were shipped to Eurofins Laboratory in Lancaster, Pennsylvania (TA is a subsidiary of Eurofins). The samples were analyzed by one or more of the methods listed below:

- Volatile organic compounds (VOCs) by USEPA Method SW8260B
- Metals by USEPA SW6020
- Mercury by USEPA SW7470A
- Hexavalent Chromium by USEPA 218.6
- Explosives by USEPA SW8330B
- Pentachlorophenol by USEPA SW8151A or SW8270-SIM
- Polychlorinated biphenyls (PCBs) by USEPA SW8082
- Dioxins/furans by USEPA SW8290

Sixty-five sample delivery groups (SDGs) were evaluated for data quality. Table 1 provides a listing of the SDGs, sample identifications and collection and analysis chronology associated with the project samples.

2.0 Field Sample Collection

The fieldwork was conducted between April 20, 2018, and July 11, 2019. Two hundred thirty groundwater samples, 3 soil samples, 15 groundwater field duplicates, (FD), one soil FD, were collected as part of the investigation.

Matrix spike/matrix spike duplicates (MS/MSD) and equipment blanks were collected at the required frequency for the sampling effort. Trip blanks were included with sample coolers containing VOCs as required per the QAPP. Table 2 includes a summary of the field samples collected by date.

3.0 Data Review and Validation Process

3.1 Data Validation Definition

Analytical data from this investigation were evaluated as described in the QAPP. One hundred percent of definitive analytical results were validated. The assessment of definitive data includes a review of the following laboratory summary forms as defined in the QAPP:

- Chain-of-custody documentation
- Holding time compliance
- Sample results and detection limit checks
- QC sample frequencies
- Blanks (method, field, calibration)
- Laboratory control sample recoveries
- Surrogate spike recoveries
- MS/MSD recoveries and precision
- Initial and continuing calibration summary information
- Internal Standards
- Tuning criteria
- Confirmation column criteria (where applicable) precision
- Interference check standards
- Field duplicate precision
- Serial dilutions
- Post digestion spikes
- Case narrative review, laboratory flagging review, and other method-specific criteria

3.2 Overall Data Validation Findings

An overall summary of the data validation is contained in the following sections and presented in Table 3. Table 3 is presented so that each validation flag applied to a method/matrix/analyte is shown, to provide the percentage of results impacted by a specific data quality condition or flag, with respect to the total results available for any target analyte/matrix. Only out-of-control conditions noted during the data validation are discussed in Table 3 and in the following subsections.

3.3 Results Detected Between the Detection Limit and Reporting Limit

Analytes that were detected at concentrations greater than the detection limit (DL), but less than the limit or quantitation (LOQ), were qualified as "J" per the QAPP to reflect the uncertainty associated with concentrations of analytical data between the DL and the LOQ. Non-detected sample results were reported to the limit of detection (LOD).

3.4 Holding Time

Overall, holding time criteria were met; however, there were a few exceptions:

- The holding time for sample preparation exceeded the criteria of 7 days for pentachlorophenol and/or explosives in three samples, indicating a possible low bias. The data were qualified as estimated detected and non-detected results and flagged “J/UJ”, respectively, in the associated samples.
- The analytical holding time of 40 days for explosives exceeded criteria in one groundwater sample, indicating a possible low bias. The associated result was qualified as an estimated detected result and flagged “J” in the sample.

The qualified results are shown in Table 4.

3.5 Matrix Spike/Matrix Spike Duplicate

MS/MSD samples were analyzed as required and accuracy and precision criteria were in control with the following exceptions:

- Several analytes were recovered less than the lower control limits in a few MS/MSDs associated with the hexavalent chromium, VOCs and explosives analyses in groundwater, indicating a possible low bias. The data were qualified as estimated detected and non-detected results and flagged “J/UJ”, respectively, in the respective parent samples. In addition, a few analytes were recovered greater than the upper control limits in the MS/MSDs, indicating a possible high bias. Detected results were qualified as estimated and flagged “J” in the parent sample. Non-detected results were not qualified.
- There were a few instances where the MS/MSDs exceeded criteria; however, the data were not qualified as the parent sample concentration was significantly greater than the spike concentration.
- The relative percent differences (RPD) for several analytes exceeded criteria in a few MS/MSDs for hexavalent chromium, VOCs, and explosives. The data were qualified as estimated detected and non-detected results and flagged “J/UJ”, respectively, in the associated parent samples.

Qualified results are shown in Table 5.

3.6 Postdigestion Spikes

Postdigestion spike (PDS) samples were analyzed as required and accuracy criteria were met with the following exceptions:

- Barium and/or manganese were recovered less than criteria in a few PDSs associated with the metals analysis, indicating a possible low bias. The data were qualified as estimated detected results and flagged “J” in the parent samples.

Qualified results are shown in Table 5.

3.7 Sample Quantitation

There were a few instances in the metals analysis where the dissolved concentration was greater than the total concentration and the RPD exceeded criteria. The data were qualified as estimated detected results and flagged “J” in the associated samples.

Due to laboratory error, a few analytes identified with estimated maximum potential concentrations (EMPC) were not qualified as non-detected results in the dioxin/furan analysis. The EMPC data were qualified as non-detected results and flagged “U” in the associated samples.

There are two explosive samples from Line 800, samples L800-G-58-0818 and L800-MW28-0818 where the laboratory case narrative detailed that the sample matrix had a significant interference in the analysis. The narrative stated that the results were considered potentially false positive or false negative data. All results for these two samples are flagged “J/UJ”.

Qualified results are shown in Table 5.

3.8 Surrogate Spikes

Surrogates were added to the samples for methods requiring their use and acceptance criteria were met with the following exceptions:

- The surrogates were recovered less than the lower control limit in several groundwater samples associated with the explosive analysis, indicating a possible low bias. In addition, is the surrogates were recovered less than the lower control limits in one soil sample associated with the PCB analysis. The data were qualified as estimated detected and non-detected results and flagged “J/UJ”.
- The surrogates were recovered greater than the upper control limit in several groundwater samples associated with the explosive analysis, indicating a possible high bias. Detected results were qualified as estimated and flagged “J”. Non-detected results were not qualified.

When surrogate spikes were out of control, reanalysis of the samples was performed to confirm the condition.

Qualified data are shown in Table 6.

3.9 Internal Standard

Internal standards were added to the samples for methods requiring their use and acceptance criteria were met with the following exceptions:

- One internal standard was out of control with a low bias in eight VOC samples. All associated results were qualified as estimated concentrations and flagged “J” in the respective samples.

The qualified results are shown in Table 7.

3.10 Confirmation

The RPD between the primary column and the confirmation column exceeded criteria for several analytes associated with the explosive analysis in groundwater. The results were qualified as estimated detected and non-detected concentrations and flagged “J/UJ”.

The qualified results are shown in Table 8.

3.11 Blanks

Method blanks and field blanks were analyzed as required and were free of contamination with the following exceptions:

- Several analytes were detected in a few VOC trip blanks and/or equipment blanks. The data were qualified as non-detected results and flagged “U” when the associated sample concentrations were less than five times (10× for common lab contaminants) the blank concentrations.
- Several analytes were detected in the method blanks associated with the dioxin/furans analysis. The data were qualified as non-detected results and flagged “U” when the associated sample concentrations were less than five times the blank concentrations.

Qualified results for blank contamination are shown in Table 9.

3.12 Sample Preservations

Five groundwater samples associated with the explosives analysis were received in a shipping cooler which exceeded the temperature requirements. The data were qualified as estimated detected and non-detected results and flagged "J/UJ".

Multiple samples associated with the VOC analysis were received with headspace in the sample container greater than 6mm. The data were qualified based on a sample integrity issue, estimated detected and non-detected results and flagged "J/UJ", respectively, in the associated samples.

Qualified results for temperature and headspace issues are shown in Table 9.

3.13 Field Duplicate

FDs were collected as required and precision criteria were met with the following exception:

- The RPD for DNX exceeded criteria in FD pair WBP-TTMW-11-0319/ WBP-TTMW-F11-0319. The results were qualified as estimated and flagged "J" in the FD pair.

Qualified results are shown in Table 10.

3.14 Laboratory Control Sample

LCS/LCSDs were analyzed as required and accuracy and precision criteria were met with the following exceptions:

- Several analytes were recovered less than the lower control limits in a few groundwater LCS/LCSDs associated with the explosives and VOC analyses, indicating a possible low bias. The data were qualified as estimated detected and non-detected results and flagged "J/UJ", respectively, in the associated samples. In addition, a few analytes associated with the dioxin/furan analysis were recovered greater than the upper control limit in one LCS, indicating a possible high bias. Detected results were qualified as estimated and flagged "J" in the associated samples.
- The RPDs for several analytes associated with the VOC and explosive methods exceeded criteria in several LCS/LCSDs. The data were qualified as estimated detected and non-detected results and flagged "J/UJ", respectively, in the associated samples.

Qualified results are shown in Table 11.

3.15 Calibrations

Initial and continuing calibration analyses were performed as required by the methods and acceptance criteria were met with the following exceptions:

- The percent difference (%D) for a few analytes were less than criteria in several VOC continuing calibration verification standards indicating a possible low bias. The data were qualified as estimated non-detected results and flagged "UJ" in the associated samples.

Qualified results are shown in Table 12.

4.0 Summary of Precision, Accuracy, Representativeness, Comparability, and Completeness

The quality of the field sampling efforts and laboratory results were evaluated for compliance with project data quality objectives through a review of overall PARCC. Procedures used to assess PARCC are in accordance with the respective analytical methods and the QAPP requirements.

4.1 Precision

Precision of the data were verified through the review of the field and laboratory data quality indicators that include: FD, LCS/LCSD, MS/MSD and confirmation RPDs. There were a few instances where samples were qualified for FD, LCS/LCSD, MS/MSD and/or confirmation RPD issues; however, overall precision was in control.

4.2 Accuracy

Accuracy of the data was verified through the review of the calibration data, LCS/LCSD, internal standard, surrogate, postdigestion spike and MS/MSD recoveries, as well as the evaluation of method/calibration/field blank data. Although a few analytes were qualified as estimated due to blank contamination, calibration, LCS, surrogate, internal standard, PDS and/or MS/MSD issues, overall accuracy was in control.

4.3 Representativeness

Sample data are representative of the site conditions at the time of sample collection. All samples were properly stored and preserved with the exception of a few explosive samples arriving at the laboratory with elevated cooler temperatures. Analytical data were predominantly reported from an analysis within the project-specified hold-time. Laboratory and field blank contamination was minimal and non-impacting overall to sample data.

4.4 Appropriateness of Reporting Limits

This project was designed to allow risk-based decisions to be made based on the results of common USEPA-approved analytical methodologies. Detection limits achieved are the best possible based on sample variables.

4.5 Comparability

Comparability of the data was verified through the use of standard USEPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.

4.6 Completeness

All results are usable for project objectives. There are no results rejected for project use. The completeness objective of 90 percent was met. Project completeness data are summarized in Table 13.

4.7 Conclusions

The data generated from sample analyses are of sufficient quality and quantity necessary for accomplishing project objectives. Sample results accurately indicate the presence and/or absence of target analyte contamination at sampled locations. Samples were collected and analyzed as specified in the project QAPP.

Note: The total number of validation flags may exceed the actual number of samples if multiple flags were applied to the same sample. Consequently, the percentage of total flags (flags applied/number of samples) may exceed 100 percent.

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

U = The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).

UJ = The analyte was not detected, the quantitation is an estimate.

ug/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

HTa>UCL = Holding time exceeded

HTp>UCL = Holding time exceeded

TABLE 5

Matrix Spike Precision/Accuracy - Qualified Data

%D = percent difference
%R = percent recovery
LCL = lower control limit
UCL = upper control limit

mg/L = milligrams per liter
pg/L = Undefined Unit in tlkpUnits
UG/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.
U = The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).
UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

Dissolved>Total	=	Dissolved metal result greater than the total metal result
EMPC	=	Estimated Maximum Possible Concentration
Matrix Interference	=	Matrix Interference
MS<LCL	=	Matrix spike recovery less than lower control limit
MS>UCL	=	Matrix spike recovery greater than upper control limit
MSRPD	=	Matrix spike RPD criteria exceedance
PDS	=	Post digestion spike failed
PDS<LCL	=	Post-Digestion Spike recovery less than the lower control limit
SD<LCL	=	Matrix spike duplicate recovery criteria less than lower control limit
SD>UCL	=	Matrix spike duplicate recovery criteria greater than upper control limit

%R = percent recovery
LCL = lower control limit
UCL = upper control limit

mg/Kg = milligrams per kilogram
ug/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:
J = The analyte was positively identified, the quantitation is an estimate.
UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:
Sur<LCL = Surrogate recovery less than lower limit
Sur>UCL = Surrogate recovery greater than upper limit

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

CF>RPD = Confirmation Precision Exceeded

TABLE 9

Blank Contamination - Qualified Data

pg/L = Undefined Unit in tlkpUnits

ug/L = micrograms per liter

Blank target = concentration of field or laboratory blank.

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

U = The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).

UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

EB<RL	=	Equipment blank concentration less than the RL
EB>RL	=	Equipment blank concentration greater than the RL
LB<1/2RL	=	Laboratory blank contamination less than 1/2 the RL
LB<RL	=	Laboratory blank contamination less than the RL
SI	=	Sample Integrity, VOC vials with >6mm bubbles
TB<RL	=	Trip blank concentration less than RL
TEMP>6C	=	Temperature Blank>6C

TABLE 10

Field Duplicate Precision - Qualified Data

Analyte	Sample Identification	Result	Field Duplicate Qualifier*	Criteria	Validation Comments

RPD = relative percent difference

ug/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

Criteria:

FD>RPD = Field duplicate exceeds RPD criteria

pg/L = Undefined Unit in tlkpUnits
ug/L = micrograms per liter

QAQC Type

N = Normal Environmental Sample
FD = Field Duplicate

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.
UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

LCS<LCL	=	LCS recovery less than lower control limit
LCS>UCL	=	LCS recovery greater than upper control limit
LCSD<LCL	=	LCSD recovery less than the lower control limit
LCSRPD	=	LCSD RPD criteria exceeded

Data Quality Evaluation Report

This report contains the Data Quality Evaluation for groundwater and surface water samples collected December 11, 2019, through June 6, 2020, as part of the Remedial Investigation at the Iowa Army Ammunition Plant, Middletown, Iowa. The report evaluates whether the analytical data obtained in the investigation are of sufficient quality and quantity to accomplish the project objectives.

Abbreviations and Acronyms

DL	detection limit
FD	field duplicate
LCS	laboratory control sample
LOD	limit of detection
LOQ	limit of quantitation
MS/MSD	matrix spike/matrix spike duplicate
PARCC	precision, accuracy, representativeness, completeness and comparability
PCB	polychlorinated biphenyl
QAPP	*Remedial Investigation at Iowa Army Ammunitions Plan, Middletown, Iowa*, (CH2M, 2017)
QC	quality control
RPD	relative percent difference
SDG	sample delivery group
SVOC	semivolatile organic compounds
TA	TestAmerica Laboratory
USEPA	U.S. Environmental Protection Agency
VOC	volatile organic compounds

1.0 Introduction

This Data Quality Evaluation Report contains an assessment of the quality and usability of analytical data from groundwater and surface water samples collected at the Iowa Army Ammunition Plant, Middletown, Iowa project site.

The analytical work was conducted in accordance with the project-specific quality assurance project plan, *Remedial Investigation at the Iowa Army Ammunition Plant, Middletown, Iowa* (QAPP) (CH2M 2017).

The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability and completeness (PARCC) as described in the QAPP. This report is intended as a general data quality assessment designed to summarize data issues.

1.1 Analytical Laboratories and Analytical Methods

The samples were collected and shipped via overnight carrier to TestAmerica (TA) Laboratories at Arvada, Colorado or St. Louis, Missouri. Samples collected for hexavalent chromium were shipped to Eurofins Laboratory in Lancaster, Pennsylvania (TA is a subsidiary of Eurofins). Samples for pentachlorophenol were shipped directly to TA in Savanna, Georgia. The samples were analyzed by one or more of the methods listed below:

- Volatile organic compounds (VOCs) by USEPA Method SW8260B
- Metals by USEPA SW6020
- Mercury by USEPA SW7470A
- Hexavalent Chromium by USEPA 218.6
- Explosives by USEPA SW8330B
- Pentachlorophenol by USEPA SW8151A

Nineteen sample delivery groups (SDGs) were evaluated for data quality. Table 1 provides a listing of the SDGs, sample identifications and collection and analysis chronology associated with the project samples.

2.0 Field Sample Collection

The fieldwork was conducted December 11, 2019, through June 10, 2020. Twenty-nine groundwater samples and six groundwater field duplicates as well as 12 surface water samples. No surface water field duplicates were collected.

Matrix spike/matrix spike duplicates (MS/MSD) and equipment blanks were collected at the required frequency for the sampling effort. Trip blanks were included with sample coolers containing VOCs. Table 2 includes a summary of the field samples collected by date.

3.0 Data Review and Validation Process

3.1 Data Validation Definition

Analytical data from this investigation were evaluated as described in the QAPP. One hundred percent of definitive analytical results were validated, Stage 2B. The assessment of definitive data includes a review of the following laboratory summary forms as defined in the QAPP:

- Chain-of-custody documentation

- Holding time compliance
- Sample results and detection limit checks
- QC sample frequencies
- Blanks (method, field, calibration)
- Laboratory control sample recoveries
- Surrogate spike recoveries
- MS/MSD recoveries and precision
- Initial and continuing calibration summary information
- Internal Standards
- Tuning criteria
- Confirmation column criteria (where applicable) precision
- Interference check standards
- Field duplicate precision
- Serial dilutions
- Post digestion spikes
- Case narrative review, laboratory flagging review, and other method-specific criteria

3.2 Overall Data Validation Findings

An overall summary of the data validation is contained in the following sections and presented in Table 3. Table 3 is presented so that each validation flag applied to a method/matrix/analyte is shown, to provide the percentage of results impacted by a specific data quality condition or flag, with respect to the total results available for any target analyte/matrix. Only out-of-control conditions noted during the data validation are discussed in Table 3 and in the following subsections.

3.3 Results Detected Between the Detection Limit and Reporting Limit

Analytes that were detected at concentrations greater than the detection limit (DL), but less than the limit of quantitation (LOQ), were qualified as “J” per the QAPP to reflect the uncertainty associated with concentrations of analytical data between the DL and the LOQ. Non-detected sample results were reported to the limit of detection (LOD).

3.4 Holding Time

Overall, holding time criteria were met with the following exceptions:

- The sample preparation hold time of seven days for pentachlorophenol by Method SW8151A exceeded criteria in two samples indicating a possible significant low bias. The nondetected results were flagged “X”, indicating the data may not be usable. The samples were re-collected at a later date and analyzed within hold time criteria.
- One VOC sample was received with a pH greater than 2. The sample was analyzed past the hold time criteria of seven days for unpreserved samples, resulting in the data being qualified as estimated. The associated results were qualified as estimated nondetected concentrations and flagged “UJ”.

The qualified results are shown in Table 4.

3.5 Matrix Spike/Matrix Spike Duplicate

MS/MSD samples were analyzed as required and accuracy and precision criteria were in control with the following exceptions:

- One sample exceeded the MSD with a high bias for aluminum. The data were qualified as estimated detected results and flagged “J” in the respective parent sample.
- Several analytes were recovered less than the lower control limit in a few MS and/or MSD samples for pentachlorophenol, VOCs and explosives, indicating a possible low bias The data were qualified as estimated detected and nondetected results and flagged “J/UJ”, respectively, in the respective parent samples.

Qualified results are shown in Table 5.

3.6 Postdigestion Spikes, Serial Dilutions

Postdigestion spike (PDS) samples or serial dilutions were analyzed as required and criteria were met with the following exceptions:

- Two metals samples exceeded post digestion spike or serial dilutions for barium, iron or manganese. In addition, one sample exceeded the ICSA check requirements for cadmium. The data were qualified as estimated detected results and flagged “J” in the respective parent samples.

Qualified results are shown in Table 5.

3.7 Laboratory Control Sample

LCS/LCSDs were analyzed as required and accuracy and precision criteria were met with the following exceptions:

- Two analytes were recovered less than the lower control limits in one groundwater LCS associated with VOC analyses, indicating a possible low bias. The data were qualified as estimated nondetected results and flagged “UJ” in the associated sample.

Qualified results are shown in Table 6.

3.8 Surrogate Spikes

Surrogates were added to the samples for methods requiring their use and acceptance criteria were met with the following exceptions:

- The surrogates were recovered less than the lower control limit in three groundwater samples associated with the explosive analysis, indicating a possible low bias. The data were qualified as estimated detected and nondetected results and flagged “J/UJ”.
- Surrogates were recovered greater than the upper control limit in several groundwater samples associated with the explosive analysis, indicating a possible high bias. The associated nondetected results were not qualified per the QAPP.

When surrogate spikes were out of control, reanalysis of the samples was performed to confirm the condition.

Qualified data are shown in Table 7.

3.9 Blanks

Method blanks, calibration blanks and field blanks were analyzed as required and were free of contamination with the following exceptions:

- Nickel was detected in an equipment blank less than the LOQ. The data were qualified as nondetected results and flagged "U" when the associated sample concentrations were less than five times the blank concentration.
- Thallium was detected in a calibration blank less than the LOQ. The data were qualified as nondetected results and flagged "U" when the associated sample concentrations were less than five times the blank concentrations.

The qualified results are shown in Table 8.

3.10 Confirmation

The RPD between the primary column and the confirmation column exceeded criteria for several analytes in multiple samples associated with the explosive analysis in groundwater and surface water. The results were qualified as estimated detected concentrations and flagged "J".

The qualified results are shown in Table 9.

3.11 Calibrations

Initial and continuing calibration analyses were performed as required by the methods and acceptance criteria were met with the following exceptions:

- The percent difference (%D) for a few VOC and explosive analytes were less than criteria in several continuing calibration verification standards indicating a possible low bias. The data were qualified as estimated detected or nondetected results and flagged "J/UJ", respectively, in the associated samples.

Qualified results are shown in Table 10.

4.0 Summary of Precision, Accuracy, Representativeness, Comparability, and Completeness

The quality of the field sampling efforts and laboratory results were evaluated for compliance with project data quality objectives through a review of overall PARCC. Procedures used to assess PARCC are in accordance with the respective analytical methods and the QAPP requirements.

4.1 Precision

Precision of the data were verified through the review of the field and laboratory data quality indicators that include FD, LCS/LCSD, MS/MSD, serial dilution and confirmation RPDs. There were a few instances where samples were qualified for MS/MSD, serial dilution and/or confirmation RPD issues; however, overall precision was in control.

4.2 Accuracy

Accuracy of the data was verified through the review of the calibration data, LCS/LCSD, internal standard, surrogate, post digestion spike and MS/MSD recoveries, as well as the evaluation of method/calibration/field blank data. Although a few analytes were qualified as estimated due to blank contamination, calibration, LCS, surrogate, PDS and/or MS/MSD issues, overall accuracy was in control.

4.3 Representativeness

Sample data are representative of the site conditions at the time of sample collection. All samples were properly stored and preserved except for a one VOC sample where the pH was >2 at the time of analysis. Analytical data were predominantly reported from an analysis within the project-specified hold time. Laboratory and field blank contamination was minimal and nonimpacting overall to sample data.

4.4 Appropriateness of Reporting Limits

This project was designed to allow risk-based decisions to be made based on the results of common USEPA-approved analytical methodologies. Detection limits achieved are the best possible based on sample variables.

4.5 Comparability

Comparability of the data was verified through the use of standard USEPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.

4.6 Completeness

All results are usable for project objectives. There are no results rejected for project use. The completeness objective of 90 percent was met. As previously stated, the sample and it's duplicate of pentachlorophenol that significantly exceeded hold time was re-collected, the re-collected data are acceptable and within the hold time. Project completeness data are summarized in Table 13.

4.7 Conclusions

The data generated from sample analyses are of sufficient quality and quantity necessary for accomplishing project objectives. Sample results accurately indicate the presence and/or absence of target analyte contamination at sampled locations. Samples were collected and analyzed as specified in the project QAPP.

Note: The total number of validation flags may exceed the actual number of samples if multiple flags were applied to the same sample. Consequently, the percentage of total flags (flags applied/number of samples) may exceed 100 percent.

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

U = The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).

UJ = The analyte was not detected, the quantitation is an estimate.

TABLE 5

Matrix Spike Precision/Accuracy - Qualified Data

%D = percent difference
%R = percent recovery
LCL = lower control limit
UCL = upper control limit

mg/L = milligrams per liter
pg/L = Undefined Unit in tlkpUnits
UG/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J	=	The analyte was positively identified, the quantitation is an estimate.
U	=	The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).
UJ	=	The analyte was not detected, the quantitation is an estimate.

Criteria:

Dissolved>Total	=	Dissolved metal result greater than the total metal result
EMPC	=	Estimated Maximum Possible Concentration
Matrix Interference	=	Matrix Interference
MS<LCL	=	Matrix spike recovery less than lower control limit
MS>UCL	=	Matrix spike recovery greater than upper control limit
MSRPD	=	Matrix spike RPD criteria exceedance
PDS	=	Post digestion spike failed
PDS<LCL	=	Post-Digestion Spike recovery less than the lower control limit
SD<LCL	=	Matrix spike duplicate recovery criteria less than lower control limit
SD>UCL	=	Matrix spike duplicate recovery criteria greater than upper control limit

%R = percent recovery
LCL = lower control limit
UCL = upper control limit

mg/Kg = milligrams per kilogram
ug/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.
UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

Sur<LCL = Surrogate recovery less than lower limit
Sur>UCL = Surrogate recovery greater than upper limit

TABLE 9

Blank Contamination - Qualified Data

pg/L = Undefined Unit in tlkpUnits

ug/L = micrograms per liter

Blank target = concentration of field or laboratory blank.

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

U = The analyte was not detected in the analysis. The associated numerical value is at or below the method detection limit (MDL).

UJ = The analyte was not detected, the quantitation is an estimate.

Criteria:

EB<RL	=	Equipment blank concentration less than the RL
EB>RL	=	Equipment blank concentration greater than the RL
LB<1/2RL	=	Laboratory blank contamination less than 1/2 the RL
LB<RL	=	Laboratory blank contamination less than the RL
SI	=	Sample Integrity, VOC vials with >6mm bubbles
TB<RL	=	Trip blank concentration less than RL
TEMP>6C	=	Temperature Blank>6C

TABLE 10

Field Duplicate Precision - Qualified Data

Analyte	Sample Identification	Result	Field Duplicate Qualifier*	Criteria	Validation Comments
Method (Matrix): SW8330B (WATER)					
hexahydro-1,3-dinitroso-5-nitro-1,3,5-triazine (DNX)	WBP-TTMW-11-0319	23 ug/L	J	FD>RPD	
	WBP-TTMW-F11-0319	36 ug/L	J	FD>RPD	

RPD = relative percent difference

ug/L = micrograms per liter

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J = The analyte was positively identified, the quantitation is an estimate.

Criteria:

FD>RPD = Field duplicate exceeds RPD criteria

TABLE 11

Laboratory Control Sample - Qualified Data

%R = percent recovery

pg/L = Undefined Unit in tlkpUnits

ug/L = micrograms per liter

QAQC Type

N = Normal Environmental Sample
FD = Field Duplicate

* The most severe flag for each analyte becomes the final validation flag.

Qualifier Description:

J	=	The analyte was positively identified, the quantitation is an estimate.
UJ	=	The analyte was not detected, the quantitation is an estimate.

Criteria:

LCS<LCL	=	LCS recovery less than lower control limit
LCS>UCL	=	LCS recovery greater than upper control limit
LCSD<LCL	=	LCSD recovery less than the lower control limit
LCSRPD	=	LCSD RPD criteria exceeded
