SECTION 1

Introduction

This document presents the ecological risk assessment (ERA) using a watershed-based approach for surface water and sediment at the Iowa Army Ammunition Plant (IAAAP), in Middletown, Iowa. The IAAAP has been placed under the U.S. Department of Defense (DoD) Installation Restoration Program (IRP), which follows the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) process, as amended by the Superfund Amendments and Reauthorization Act. This work was conducted under U.S. Army Corps of Engineers, Louisville District (USACE), Contract W912QR-12-D-0005, Delivery Order 0006.

This watershed-based ERA is a Facility-wide document that has been prepared to support remedial investigation (RI) at IAAAP from this point forward. RIs are currently ongoing for four operable units (OUs) at IAAAP: OU-6, OU-7, OU-10, and OU-12. This new ERA evaluates potential adverse effects to aquatic receptors from surface water and sediment collectively within the four major watersheds across IAAAP: Skunk River watershed, Brush Creek watershed, Long Creek watershed, and Spring Creek watershed. As discussed in the final *Site-specific Worksheets for Watersheds of the Uniform Federal Policy–Quality Assurance Project Plan* [UFP-QAPP] *for the Remedial Investigation at Iowa Army Ammunition Plant, Middletown, Iowa* (CH2M 2018), the watershed approach allows for evaluating the potential migration of chemicals in surface water and sediment outside the boundaries of individual areas of concern, or IAAAP sites, at the facility. The watershed approach is also applicable given that aquatic ecological receptors are not confined within an individual IAAAP site's boundary.

Evaluations of potential ecological adverse effects to terrestrial receptors are not included in this watershed-based ERA because soil and groundwater media are evaluated under each of the individual areas of concern, or IAAAP environmental sites, and not by watershed. Because these individual IAAAP sites are evaluated in OU-specific RI reports, they are summarized but not discussed in detail in this watershed-based ERA. Terrestrial ERAs, which were conducted for individual IAAAP sites, are included in the OU-specific RI reports that include the applicable IAAAP sites.

This new watershed-based ERA uses the approaches set forth in the draft final *Baseline Ecological Risk Assessment (BERA), Iowa Army Ammunition Plant (IAAAP), Iowa* (MWH 2004), which also evaluated the potential adverse effects to aquatic receptors within IAAAP by watershed. The 2004 BERA was completed following the U.S. Environmental Protection Agency's (USEPA's) eight-step approach for conducting ERAs (USEPA 1992, 1997, 1998b). The ERA used surface water and sediment data collected in 2000 specifically for the BERA; sample locations were selected by a team consisting of representatives of USACE, Harza, USEPA, and Techlaw as part of a comprehensive sediment and surface water investigation. The first two steps of the ERA process, which compose the screening level ecological risk assessment (SLERA), identified the complete exposure pathways and associated chemicals of potential ecological concern (COPECs) present in site media. Assumptions from the 2004 BERA (including the SLERA) served as the basis to evaluate potential adverse effects to ecological receptors at IAAAP for this new ERA. This new watershed-based ERA utilized the data evaluated under the 2004 BERA in combination with more recent data to refine the ecological conceptual site model (ECSM) for IAAAP and the watersheds.

1.1 Installation Background

1.1.1 IAAAP Description

The IAAAP consists of 19,011 acres adjacent to Middletown, in Des Moines County, Iowa. It is approximately 8 miles west of Burlington, and with a population of 25,436, is the largest city in Des

Moines County. The installation is bordered by Highway 34 to the north, upland agricultural farms to the east and west, and the Skunk River Valley to the south. The installation layout is shown on Figure 1-1.

The IAAAP is an active Joint Munitions Command facility currently operated by civilian contractor American Ordnance. The current mission of the IAAAP is to load, assemble, and pack ammunition items, including projectiles, mortar rounds, warheads, demolition charges, and munitions components such as fuses, primers, and boosters, for a variety of conventional ammunition and fusing systems. Approximately one third of the IAAAP property is occupied by active or formerly active production or storage facilities. The IAAAP consists of production lines, landfills, disposal areas, burn areas, a demolition area, and a fire training area. The remaining land is either woodlands or property leased for agricultural usage. The locations of the IAAAP sites and watershed boundaries are shown on Figure 1-2.

1.1.2 IAAAP Operational History

IAAAP was constructed in November 1940 as the Iowa Ordnance Plant and started production in 1941. Production was stopped in 1945, when World War II ended. The plant resumed its ammunition manufacturing mission in 1949, prior to the Korean War. In 1950, in response to the Korean conflict, production increased dramatically. From 1947 through mid-1975, the former Atomic Energy Commission occupied facilities on the site for nuclear weapons and non-nuclear additional weapons-assembly operations; those facilities then reverted to Army control in 1975 (H&S Environmental 2016).

The IAAAP has a National Pollutant Discharge Elimination System permit in place (Permit 2900900) as part of its operations. In 1995, permitted outfalls were reported at Lines 1, 2, 3, 5, and 800, which discharged to Brush Creek, and at Line 3A, which discharged to the Skunk River. At that time, combined Royal Demolition Explosive (RDX) plus hot melt explosive (HMX) discharge concentrations were as high as 1,410 micrograms per liter (µg/L), and 2,4,6-trinitrotoluene (TNT) discharge concentrations were as high as 2,540 µg/L (JAYCOR 1996).

The 2001 permit allowed discharge of effluent with explosives (TNT and RDX + HMX) from 11 outfalls at the facility. The permit was updated in 2020 and currently allows for seven outfalls to discharge effluent with explosives with a 30-day average of 0.75 milligrams per liter (mg/L) and daily maximum discharge of 2.25 mg/L for RDX + HMX, and with a 30-day average of 0.33 mg/L and daily maximum discharge of 1.00 mg/L for TNT (Figure 1-3). Five outfalls included on the updated permit do not include explosives.

1.1.3 IAAAP Regulatory Setting

Due to explosives-contaminated surface water leaving the installation boundaries, the IAAAP was added to the National Priorities List in August 1990. In September 1990, a Federal Facility Agreement (FFA) was signed by USEPA Region 7 and the U.S. Army; it became effective in December 1990. The 1990 FFA identified 30 Resource Conservation and Recovery Act (RCRA) Solid Waste Management Units at the facility. The 2018 RCRA Permit (USEPA 2018a) stated that the Solid Waste Management Units listed in the 1990 FFA are being integrated into the CERCLA sites; the integration plan is currently being developed. Through the FFA, the U.S. Army works with USEPA, with support provided by Iowa Department of Natural Resources. The IAAAP was placed under the DoD IRP, which follows the CERCLA process, as amended by the Superfund Amendments and Reauthorization Act.

In July 2002, several areas of the IAAAP previously used by the former Atomic Energy Commission were designated by USACE to be under the Formerly Utilized Sites Remedial Action Program (FUSRAP) and therefore were subsequently removed from the DoD IRP (U.S. Army 2007). Investigations continued at the FUSRAP areas, and an additional FFA for FUSRAP was finalized in August 2006 (USACE 2011).

The IAAAP is currently divided into 11 proposed OUs:

- OU-1 (Soils): soil on the IAAAP other than those contaminated by use or testing of military munitions or by radiological chemicals

- OU-3 (Offsite Groundwater): groundwater outside of the IAAAP boundary
- OU-4 (Inert Disposal Area): the Inert Disposal Area and its associated landfills, trenches, and sedimentation ponds
- OU-5 (Military Munitions Response Program): Military Munitions Response Program sites
- OU-6 (Onsite Groundwater): groundwater within the IAAAP boundary
- OU-7 (Installation-wide): Miscellaneous IAAAP sites not included in the other OUs
- OU-8 (FUSRAP): sites contaminated by radiological and other contaminants by former Atomic Energy Commission activities and now being addressed by FUSRAP
- OU-9 (Construction Debris Areas): construction debris disposal sites
- OU-10 (Explosive Disposal Area): groundwater sites associated with Explosive Disposal Area
- OU-11 (No Further Action): IRP sites that warrant no further action following the RI
- OU-12 (Compliance Cleanup): IRP sites that were formerly managed under the RCRA Compliance Cleanup (CC) program

OU-2 was also established originally for soil removal actions but was subsequently merged into OU-1. OU-10, OU-11, and OU-12 are new OU divisions that have been proposed based on recommended remedial actions for the IAAAP sites to help streamline the CERCLA process.

1.1.4 Watershed Descriptions

A watershed is an area of land that drains to a common water outlet, such as a creek or ocean. A watershed includes all the surface water (that is, lakes, reservoirs, and wetlands) within the defined land area. The IAAAP contains five different hydrologic watersheds: Brush Creek, Little Flint Creek, Long Creek, Skunk River, and Spring Creek (Figure 1-2). These four creeks and Skunk River are the common water outlets, or water features, to which the watersheds drain. Because surface water does not cross watershed boundaries, surface water in drainages in the Brush Creek watershed (for example) will not flow into the Long Creek watershed (Figure 1-2). At the IAAAP, the Brush Creek and the Long Creek watersheds drain most of the installation. The watersheds are managed by IAAAP for military use, recreational use (such as hunting and fishing), and maintenance of populations of sensitive species (Stantec 2018).

The five watersheds are summarized as follows:

1.1.4.1 Skunk River

The Skunk River watershed encompasses approximately 2,400 acres in the southwest corner of the IAAAP and is fed primarily by Long Creek and Brush Creek and small intermittent tributaries (Tetra Tech 2006). This watershed drains to Skunk River, which is just outside the southwest boundary of the IAAAP. The river then flows generally east-southeast. The Skunk River watershed is generally undeveloped. An unnamed tributary of the Skunk River receives industrial discharge under a National Pollutant Discharge Elimination System (NPDES) permit.

Four IAAAP areas with IRP sites undergoing RI (under OU-6, OU-7, or OU-12) are located within the Skunk River watershed. These areas and IRP sites, including physical and ecological conditions, topography, and potential sources to the watershed, are summarized in Table 1-1.

1.1.4.2 Brush Creek

The Brush Creek watershed is approximately 5,000 acres in the east-central portion of the IAAAP and is fed by intermittent tributaries. Water that drains into Brush Creek flows generally south and exits at the

southeastern boundary of the IAAAP. Approximately 3 miles beyond the IAAAP, the creek flows into the Skunk River (Tetra Tech 2006). Brush Creek receives industrial discharge under an NPDES permit.

Brush Creek is the most developed watershed. Seventeen IAAAP areas with IRP sites undergoing RI (under OU-6 or OU-7) or that have recently completed RI (under OU-11 or OU-9) are located within the Brush Creek watershed. These areas and IRP sites, including physical and ecological conditions, topography, and potential sources to the watershed, are summarized in Table 1-2.

1.1.4.3 Long Creek

The Long Creek watershed encompasses approximately 8,000 acres in the west-central portion of the IAAAP and is fed by unnamed perennial tributaries from the north and many small intermittent tributaries (Tetra Tech 2006). Long Creek has been dammed to form George H. Mathes Lake within the central area of the IAAAP. Mathes Lake is used recreationally for fishing and is managed to support a large and diverse fish community. Water that drains into Long Creek generally flows east-southeast and south and exits at the southeastern boundary of the installation. Approximately half a mile beyond the IAAAP, the creek flows into the Skunk River (Tetra Tech 2006). Development is scattered in the watershed. Long Creek receives industrial discharge under a NPDES permit.

Fifteen IAAAP areas with IRP sites undergoing RI (under OU-7, OU-10, or OU-12) or that have recently completed RI (under OU-11) are located within the Long Creek watershed. These areas and IRP sites, including physical and ecological conditions, topography, and potential sources to the watershed, are summarized in Table 1-3.

1.1.4.4 Spring Creek

The Spring Creek watershed encompasses approximately 4,000 acres in the eastern portion of the IAAAP and is fed by perennial tributaries from the north and east and several smaller intermittent tributaries (Tetra Tech 2006). Water that drains into Spring Creek generally flows south and exits at the southeastern boundary of the IAAAP. The creek eventually discharges into the Mississippi River.

Thirteen IAAAP areas with IRP sites undergoing RI (under OU-6 or OU-7) or that have recently completed RI (under OU-4 or OU-11) are located within Spring Creek watershed. These areas and IRP sites, including physical and ecological conditions, topography, and potential sources to the watershed, are summarized in Table 1-4.

1.1.4.5 Little Flint Creek

The Little Flint Creek watershed comprises a very small area in the north-central portion of the facility. Water that drains into this watershed flows northward, away from the installation, before turning south again and joining the Spring Creek watershed (Tetra Tech 2006). No environmental IRP sites are located within Little Flint Creek watershed. Therefore, this watershed is not discussed any further in this document.

1.2 Previous Ecological Risk Assessments at IAAAP

Several ecological risk evaluations have been performed for IAAAP as part of the RI process. To support these previous assessments, an ERA team was formed to discuss the approach, progress, and direction of the risk evaluations; this team included representatives from IAAAP, USACE, U.S. Army Center for Health Promotion and Preventive Medicine, USEPA, and U.S. Fish and Wildlife Service (USFWS) (MWH 2004). A summary of previous ERAs for IAAAP are bulleted below.

- As part of the 1996 RI (JAYCOR 1996), a Facility-wide ERA was prepared for IAAAP. After reviewing the ERA, USEPA recommended that additional data be collected to evaluate potential adverse effects to the IAAAP ecosystem.

- In 1996, an inventory and assessment of habitats and biota of IAAAP was published (Horton et al. 1996). While their objective was to assess the entire facility, they focused on natural areas along creeks and drainage ways, where temperate deciduous forest predominates. The forest community structure quality index as determined by Horton et al. (1996) was evaluated to assess the health of the vascular plant communities, if potentially affected by chemical contamination or land use practices.
- An addendum to the 1996 ERA was conducted and a field investigation was initiated between 1997 and 1998 to address the data needs identified by USEPA. However, the field investigation was not finalized because USEPA's ERA guidance (USEPA 1997), which outlines the eight-step approach for conducting ERAs, became available at this same time. Therefore, it was decided that a new risk assessment (i.e., the BERA) should be conducted at IAAAP using the revised approach.
- Between 1999 and 2001, a series of technical memorandums (TMs) was prepared to facilitate review and concurrence on the general approach for the SLERA and the BERA for IAAAP (MWH 2004). These documents served as the planning steps to be used instead of a formal BERA work plan. The first four TMs defined the procedures, models, and data collection process. Another TM presented the dose models and toxicity reference values (TRVs). As part of this process, the screening values to be used in the SLERA were also developed.
- In 2001, a draft SLERA was conducted for IAAAP in conformance with the planning TMs and submitted to the ERA team for review. USEPA commented that the screening process should be modified.
- In 2003, a draft final SLERA was developed that incorporated changes that were made to address USEPA comments (MWH 2004). The draft final SLERA included screening level problem formulation and confirmed that complete exposure pathways exist for some media. Consequently, COPECs were identified for several media for further evaluation in the BERA.
- A draft BERA was developed in 2003 with the objective of evaluating potential adverse effects to ecological receptors due to operations at the IAAAP. It was conducted using surface water and sediment data collected in 2000 specifically for the BERA; sample locations were selected by the ERA team. Several stakeholders, including USEPA and USFWS, provided comments on the draft BERA. To address USFWS comments, a fifth TM was developed, in 2004, which included discussion of TRVs for the Indiana bat and the ecological conceptual models (MWH 2004).
- The BERA was updated in 2004 and incorporated changes based on stakeholder comments (MWH 2004). The 2004 BERA evaluated both terrestrial and aquatic habitats using USEPA's eight-step approach for ERAs (USEPA 1997). The following conclusions were made:
  - The results of the terrestrial evaluation indicated potential for adverse effects to terrestrial receptors, but that hazard estimates were uncertain and likely due to isolated exceedances.
  - The BERA utilized a watershed-based approach to evaluate the aquatic habitats. The results of the BERA, based on the multiple lines of evidence, concluded that the fish populations, and the benthic invertebrate populations in the streams evaluated do not appear to be impacted (based on direct comparison to screening values). However, exceedances identified at several locations provided a level of uncertainty.
  - Upper trophic receptors evaluated using food-web models included the belted kingfisher and the Indiana bat. The results of this evaluation also indicated a potential for negligible (acceptable) adverse effects; however, several locations had elevated hazard quotients (HQs) that provided a level of uncertainty.

- Overall, the 2004 BERA concluded that additional evaluations should be performed to reduce identified uncertainties and to determine whether unacceptable ecological adverse effects are present at IAAAP.

The updated watershed ERA, which is presented in this document, is based on the 2004 BERA and further evaluates the potential adverse effects from site-related chemicals in sediment and surface water to aquatic ecological receptors. The ERA also considers surface water and sediment data collected at IAAAP subsequent to the 2004 BERA, as discussed in Section 4. Evaluations of terrestrial ecological receptors are being conducted separately at individual IAAAP sites, where potentially complete pathways exist; these terrestrial ERAs are included in the RI reports that include the applicable IAAAP sites.

SECTION 2

Ecological Risk Assessment Methods and Document Organization

When applicable, this ERA process follows the USEPA eight-step process (USEPA 1997b, 1998a), which is described in the UFP-QAPP (CH2M 2017) and shown on Figure 2-1. Accordingly, this document is organized as follows:

- Section 3—Screening Level Problem Formulation. Corresponds to Step 1 of the eight-step ERA process for Superfund (USEPA 1997).
- Section 4—Screening Level Exposure Estimate and Risk Calculation. Corresponds to Step 2 of the eight-step ERA process for Superfund sites (USEPA 1997).
- Section 5—Baseline Ecological Risk Assessment. Corresponds to Step 3 of the eight-step process for Superfund sites (USEPA 1997).
- Section 6—Summary and Conclusions. Summarizes the ERA results and decision outcomes.
- Section 7—References. Presents full references for the literature cited in the ERA.

In addition, several guidance documents were used to provide direction for developing the ERA, including the following:

- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments*, Interim Final (USEPA 1997)
- Final *Guidelines for Ecological Risk Assessment* (USEPA 1998b)
- *Ecological Risk Assessment and Risk Management Principles for Superfund Sites* (USEPA 1999)
- *The Role of Screening Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (USEPA 2001)
- *Wildlife Exposure Factors Handbook* (USEPA 1993)
- UFP-QAPP (CH2M 2017)
- USEPA Eco Updates: Volume 1, Numbers 1 through 5; Volume 2, Numbers 1 through 4; Volume 3, Numbers 1 and 2 (https://www.epa.gov/risk/eco-update-bulletin-series)
- USACE Environmental Quality Risk Assessment Handbook, Volume II: Environmental Evaluation. EM 200-1-4 (USACE 2010b).

This new watershed-based ERA addresses only aquatic components of each watershed. Terrestrial components of each watershed (e.g., soil) were not evaluated in the ERA as they are more appropriately used for assessing terrestrial receptors on a site-specific basis. As previously mentioned, soils were evaluated in the final RI reports for OU-1, OU-5, OU-8, OU-9, and OU-11 and will be evaluated in the future RI reports for OU-7 and OU-12.

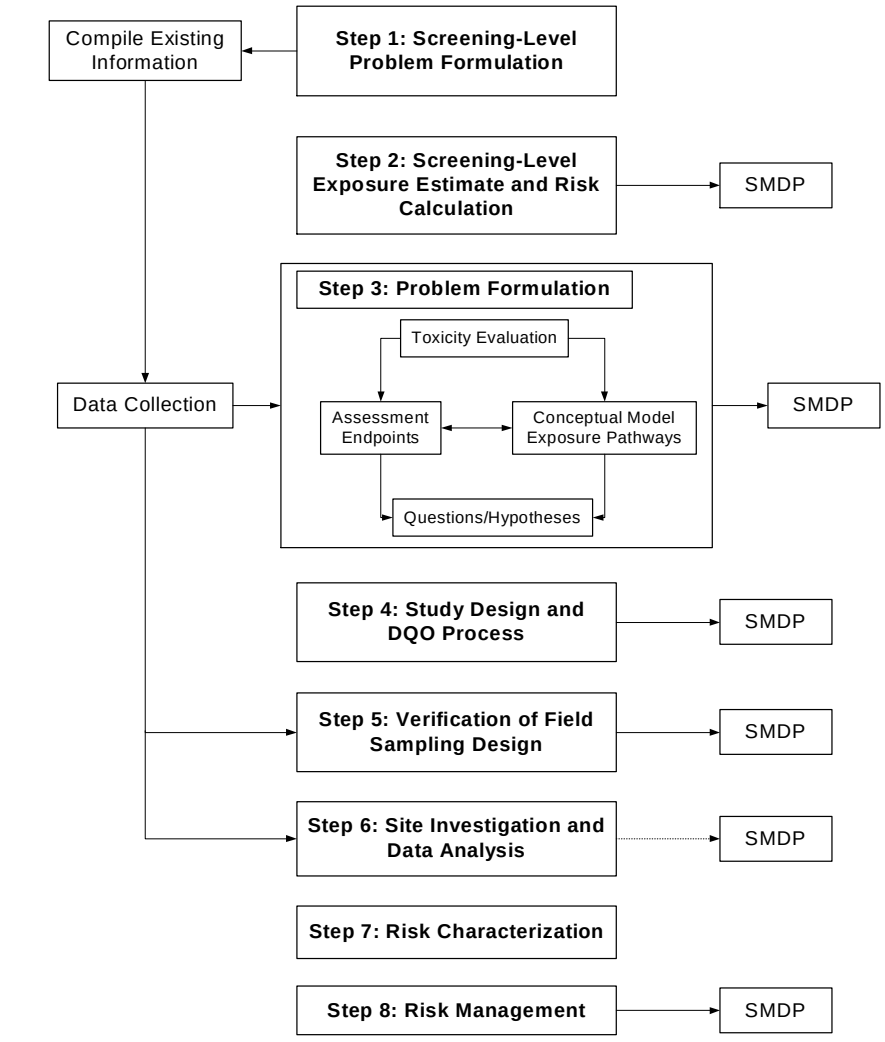

Figure 2-1. USEPA's Eight-Step Ecological Risk Assessment Process for Superfund

A summary of the eight-step process is provided below:

- Step 1 of the ERA process is intended to answer two main questions: (1) Do complete exposure pathways exist? and (2) Are sufficient data available to conduct the SLERA? If one or more complete exposure pathways are likely to exist, the ERA process continues to Step 2 for those pathways that have been determined to be critical The available data are then evaluated to determine whether they are adequate to support the SLERA. If not, additional data are collected before the ERA process continues.

- Step 2 of the ERA process involves conducting a screening exposure assessment, a screening effects assessment, and a screening risk calculation (risk characterization). The results of the SLERA are used to evaluate the potential for unacceptable ecological adverse effects based upon very conservative assumptions. If the results of the SLERA suggest that further ecological evaluation or data collection is warranted, the ERA process then proceeds to the BERA (Steps 3 through 7), which is a more detailed phase of the ERA process, for the pathways, chemicals, receptors, and areas identified in the SLERA.

- The first step of the BERA (Step 3) is the baseline problem formulation. The risk estimates from the SLERA are refined by the baseline problem formulation using more realistic exposure

assumptions, and if unacceptable adverse effects are still possible, the conceptual model and endpoints are refined to focus the subsequent steps of the ERA process.

- Following the completion of Step 3, a decision point is reached with two potential outcomes: (1) If the refined risk estimates are acceptable for each selected assessment endpoint, the investigation advances to risk characterization (Step 7) to document this conclusion, and the ERA process terminates, or (2) the risk estimates indicate that unacceptable adverse effects may exist and the ERA process continues (Steps 4 through 6). The additional data needed to support the ERA for the watersheds are presented in the approved UFP-QAPP (CH2M 2018) and serve as the basis for Steps 4 through 6 of the ERA process.

- If any COPECs are present at concentrations that indicate the need for further evaluation, the process is repeated using more site-specific and, generally, less conservative exposure assumptions, and a second calculation that includes a less conservative toxicity reference value (Step 3, baseline problem formulation). These refined calculations can lead to a decision to conduct additional studies to further refine exposure estimates and effects relationships (Steps 4 through 6) or, through completion of Step 7, serve as the baseline ERA for the site. The final step, Step 8, concludes with risk management decisions.

As described in ERA guidance (EPA 1992, 1997, 1998b), an ERA consists of three key components: (1) problem formulation, (2) analysis, and (3) risk characterization. Problem formulation involves (1) compiling and reviewing existing information on the ecological setting; (2) compiling and reviewing available analytical and biological data; (3) developing a conceptual model that identifies and evaluates potential source areas, transport pathways, fate and transport mechanisms, exposure media, exposure pathways and routes, and receptors; and (4) developing assessment and measurement endpoints for critical exposure pathways. The analysis portion of the ERA is divided into two parts: exposure assessment and effects assessment. Exposure assessment involves measuring or estimating potential exposures to ecological receptors. Effects assessment involves measuring (through Facility-specific studies) or estimating (using literature-based screening values) ecological effects for the exposed receptors. The risk characterization portion of the ERA uses the information generated during the two previous parts of the ERA (problem formulation and analysis) to estimate potential adverse effects to ecological receptors. Also included is an evaluation of the uncertainties associated with the models, assumptions, and methods used in the ERA, and their potential effects on the conclusions of the assessment.

SECTION 3

Screening Level Problem Formulation (Step 1)

This section presents the screening level problem formulation, which establishes the goals, scope, and focus of the SLERA. As part of the problem formulation, the environmental setting of the site is characterized in terms of the habitats and biota known to be or likely to be present. The types and concentrations of chemicals that are present in ecologically relevant media are also described based upon available analytical data. An ECEM is developed that describes source areas, transport pathways and exposure media, exposure pathways and routes, and receptors. Assessment endpoints, measures, and risk hypotheses are developed to evaluate those receptors for which ecologically significant exposure pathways exist. This section corresponds to Step 1 of the eight-step ERA process for Superfund sites (EPA 1997).

3.1 General Ecological Setting

The IAAAP consists of 19,011 acres adjacent to Middletown, in Des Moines County, Iowa. The IAAAP provides both terrestrial and aquatic habitats for ecological receptors. The focus of this watershed-based ERA is on aquatic receptors. The subsections below describe the aquatic habitats and receptors present at IAAAP and representative of the four watersheds (Skunk River, Brush Creek, Long Creek, and Spring Creek) evaluated in this ERA.

3.1.1 Habitat and Ecological Receptors

The available aquatic habitats at IAAAP include sections of Long Creek, Brush Creek, and Spring Creek and their respective tributaries as well as tributaries to the Skunk River. These watersheds flow predominantly through deciduous forests, old field areas, and wetlands and provide diverse habitat for aquatic receptors including fish, amphibians, benthic invertebrates as well as wildlife (mink, muskrat, beaver, racoon) and avian species (osprey, belted kingfisher, cormorant, mallard, wood duck) utilizing the aquatic habitats for food source.

Numerous bird species inhabit or migrate through the IAAAP. Some of the most common species include the American robin, northern cardinal, blue jay, red-headed woodpecker, common crow, common grackle, mourning dove, red-winged blackbird, chipping sparrow, eastern meadowlark, American goldfinch, and turkey. The red-headed woodpecker is protected under the Migratory Bird Treaty Act of 1918 (16 U.S.C. 703–712), which is administered by USFWS. Red-tailed hawks are the most common raptor species present, but bald eagles have been observed flying over the IAAAP or feeding on the fish they catch in Mathes Lake (H&S Environmental 2016).

Skunk River, Long Creek, Brush Creek, and Spring Creek are all classified by the State of Iowa as Class B(w) waters (warm water suitable for wildlife, fish, aquatic life, and secondary water uses) (Tetra Tech 2006). Mathes Lake provides habitat for fish ranging from bottom feeders such as gizzard shad and channel catfish to predatory fish, walleye, and striped bass hybrids that have been stocked by the USFWS to predate on the abundant gizzard shad (*Dorosoma cepedianum*) (H&S Environmental 2016).

3.1.2 Threatened and Endangered Species

The USFWS Illinois-Iowa Ecological Services Field Office lists three endangered aquatic species potentially within IAAAP (Appendix A):

Mussels:

- Higgins eye (perlymussel) (*Lampsilis higginsii*)—endangered
- Sheepnose mussel (*Plethobasus cyphysu*)—endangered
- Spectaclecase mussel (*Cumberlandia monodonta*)—endangered

The mussel species listed above have not been observed within the IAAAP facility. Furthermore, the preferred aquatic habitat of the listed mussel species, which is large rivers and lakes, is not present at IAAAP. The host fish species for these species to reproduce are also limited to large rivers and lakes.

Mammals:

- Indiana bat (*Myotis sodalis*)—endangered
- Northern long-eared bat (*Myotis septentrionalis*)—threatened

The USFWS Illinois-Iowa Ecological Services Field Office lists two threatened or endangered terrestrial species potentially within IAAAP (Appendix A) that could be exposed to chemicals in surface water or sediment through drinking water or consumption of emerged aquatic insects:

Both bats have been recorded on the IAAAP property. The Indiana bat has been recorded as feeding on the property and may have maternal roosts in the floodplain forests. The northern long-eared bat has also been found on the IAAAP property (Stantec 2018).

3.1.3 Sensitive Habitats

In 1999, a National Wetlands Inventory was conducted on the installation by USFWS. Based on the inventory, IAAAP contains 113.2 acres of wetland. Forested wetlands are the dominant type, representing about 50 percent of the installation's wetlands. The next most common type is unconsolidated bottoms (ponds), which compose about 24 percent of the wetlands. IAAAP contains 57.3 miles of linear wetlands including rivers and streams (3.1 miles of wetlands and 54.2 miles of rivers and streams). Wetland acreages are as follows: emergent wetland—14.7 acres; scrub/shrub wetland (broadleaved deciduous)—10.8 acres; forested wetland—60.2 acres (temporarily flooded—56.5 acres and seasonally flooded—3.7 acres); and unconsolidated bottom—27.5 acres (H&S Environmental 2016). No other sensitive habitats were identified at IAAAP.

As previously discussed, aquatic habitats associated with Skunk River, Brush Creek, Long Creek, and Spring Creek at IAAAP are being evaluated by watershed. Because no sites are located within the Little Flint Creek watershed, it is not being evaluated. For lower trophic-level receptors in these habitats (e.g., benthic invertebrates), direct contact is considered the primary exposure route. Unrooted, floating aquatic plants and rooted, submerged vascular aquatic plants and algae may be exposed to chemicals directly from the water column or (for rooted plants) from sediments.

Streamflow can fluctuate over any given year due to many factors. The amount of precipitation varies seasonally. Snow typically stays where it falls, and therefore streamflow may decrease during this period. However, if the ground is frozen when the snow melts, then runoff to the streams may increase temporarily because water cannot infiltrate into the ground. When evapotranspiration is high, as in the early spring or summer, streamflow can decrease because more water is being taken up by plants and released to the atmosphere. Streamflow is also impacted by seasonal fluctuations in the water table elevation of the surficial groundwater aquifer.

The creeks at the IAAAP have been observed to be "gaining" and "losing" streams. A gaining stream is one that gains water from groundwater, typically because the stream channel bottom is lower than the groundwater table. Therefore, groundwater will discharge to the water body. In contrast, a losing stream is one that loses water to groundwater. It is common for a creek to be a gaining stream in one area and a losing stream in another area. Also, creeks and rivers may be gaining at one time of the year and losing in another time of the year.

Brush Creek, Long Creek, Skunk River, and Spring Creek are classified by the State of Iowa as Class B(w) waters, indicating there is warm water suitable for wildlife, fish, aquatic, and semiaquatic life, and for secondary water uses. Little Flint Creek is not present within the IAAAP boundary. Adjacent riparian habitats' land use for each watershed on the IAAAP is a combination of agricultural, forested, and administrative.

3.1.4 Watershed-Specific Environmental Setting

The environmental setting for each of the four watersheds evaluated in this ERA are described in Section 1.1.4.1 (Skunk River), Section 1.1.4.2 (Brush Creek), Section 1.1.4.3 (Long Creek), and Section 1.1.4.4 (Spring Creek). Tables 1-1 through 1-4 provide detailed descriptions of the environmental setting and hydrogeologic connection for the environmental sites undergoing RI within each of the watersheds.

3.2 Ecological Conceptual Exposure Model

Important components of the ECEM are the identification of potential source areas, transport pathways, exposure media, exposure pathways and routes, and receptor groups. Actual or potential exposures of ecological receptors associated within a particular habitat is determined by identifying the most likely, and most important, pathways of contaminant release and transport. A complete exposure pathway has three components: (1) a source of chemicals (stressors) that results in a release to the environment, (2) a pathway of chemical transport through an environmental medium, and (3) an exposure or contact point for an ecological receptor. In the absence of any one of these components, an exposure pathway is considered incomplete, and, by definition, there is no adverse effect or hazard. The ECEM is illustrated on Figure 3-1, and the key components of this ECEM are discussed in the following subsections. The same ECEM is used for all four watersheds, because while sources of chemicals may vary between watersheds, the receptors and routes of exposure will be the same in all four watersheds.

3.2.1 Transport Pathways and Exposure Media

The potential source areas within IAAAP for the watersheds are presented on Figures 1-2 and 1-3. Tables 1-1 through 1-4 detail the environmental sites undergoing RI within each of the watersheds, including a description of potential sources and pathways for chemical transport.

The primary mechanisms for transport from the source areas to respective watershed(s) may include the following:

- Leaching of chemicals from soil by infiltrating precipitation and transport to groundwater. This is considered the main source for most of the potential contamination in the IAAAP site. Soils have been investigated under OU-1, OU-4, OU-5, OU-7, OU-8, OU-9, OU-11, and OU-12, and remedies are in place for soils under OU-1, OU-5, and OU-8. Interim remedial actions for soil have also been conducted at several of the other OUs.
- Transport of chemicals via groundwater to sediment and surface water
- Surface water runoff with the potential to transport particulate-bound chemicals into the respective watershed, although this transport pathway is considered relatively minor
- Historical direct discharges

3.2.2 Exposure Pathways and Routes

Source areas are addressed under the RI or Record of Decision for each individual IAAAP site. Groundwater is generally considered only as a transport medium because there are no ecological exposures to groundwater until it discharges to a water body or surfaces as a seep. This assumption is

consistent with the 2004 BERA. In this ERA, groundwater is evaluated as a potential transport medium for site-related chemicals to the surface water and the sediment of the respective watershed.

Aquatic ecological receptors are assumed to be the same within all four of the watersheds evaluated at IAAAP. Dermal and inhalation exposures were not evaluated quantitatively in the ERA for upper trophic-level receptors because of the limited availability of exposure models and effects data. Lower trophic-level receptors (aquatic community) and upper trophic-level receptors (such as mammals and birds) may be exposed to chemicals through the following routes:

- The incidental ingestion of contaminated abiotic media (sediment) during feeding activities
- The ingestion of contaminated water and incidental ingestion of contaminated sediment when feeding
- The ingestion of contaminated plant and/or animal tissues for contaminants which have entered food webs
- Direct (dermal) contact with contaminated abiotic media

Exposure to chemicals present in dry sediment via dermal contact may occur but is unlikely to represent a major exposure pathway for most upper trophic-level receptors because fur and feathers minimize dermal transfer of chemicals, and therefore this route was not considered. Direct contact to surface water and sediment was considered for lower trophic-level receptors, such as invertebrates.

3.2.3 Selection of Representative Species

To evaluate ecological exposure, representative species are selected for the functional feeding guilds identified in the ECEM (MWH 2004). For example, a belted kingfisher may be considered representative of piscivorous birds visiting the site. Consistent with *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (USEPA 1997), these species should preferably be ones that have ecological relevance, are of societal value, are susceptible to chemical stressors at the site, and allow risk managers to meet policy goals. These factors are used to select representative species common to each watershed within IAAAP.

The representative species selected for each feeding guild and habitat type for each watershed are as follows:

- Freshwater aquatic biota (fish, amphibians, water column invertebrates, and benthic infauna)
- Freshwater aquatic plants
- Piscivorous birds—belted kingfisher (*Ceryle alcyon*)
- Piscivorous mammals—mink (*Mustela vison*)
- Sensitive species (utilizing riparian corridor)—Indiana bat (*Myotis sodalis*) (as a representative species for bats in general within the watershed, including the Northern long-eared bat (*Myotis septentrionalis*)

3.2.4 Assessment Endpoints and Measures

The conclusion of the screening level problem formulation is the identification of assessment endpoints and measures. Assessment endpoints describe the valued ecological resources that are to be protected (USEPA 1998a). Assessment endpoints are selected according to their ecological relevance, their susceptibility to known or potential stressors onsite, and whether they reflect management goals for the IAAAP.

Measures are quantifiable and are predictive of assessment endpoints. The three categories of measures are measures of exposure, measures of ecological effects, and measures of ecosystem and

receptor characteristics (USEPA 1998a). They evaluate, respectively, how exposures might occur, the response of the assessment endpoints when exposed to the stressor, and the ecosystem characteristics that might affect exposure or response to the stressor. This ERA/SLERA will include both measures of exposure and measures of ecological effects. Appropriate assessment endpoints for each of the overall watersheds are identified to be in line with the following management goals and objectives as stated in the IAAAP *Natural Resource Management Plan* (Stantec 2018):

- Goal: Comply with laws and regulations that pertain to management of IAAAP's natural resources.
  - *Objective 1.* Manage natural resources within the spirit and letter of environmental laws, particularly the Sikes Act upon which this [IAAAP *Natural Resource Management Plan*] is predicated.
  - *Objective 2.* Protect, restore, and manage sensitive species and wetlands.
- Goal: Manage natural resources on IAAAP to assure good stewardship of public lands entrusted to the care of the Army.
  - *Objective 1.* Use adaptive ecosystem management strategies to protect, conserve, and enhance native fauna and flora with an emphasis on priority species and biodiversity enhancement.
  - *Objective 2.* Monitor and manage soils, water, vegetation, and wildlife on IAAAP with a consideration for all biological communities and human values associated with these resources.
- Goal: Maintain and enhance the natural diversity of aquatic communities on IAAAP.
  - *Objective 14.* Manage Mathes Lake to support a greater variety of fish and the five other primary impoundments on IAAAP for bluegill, redear, bass, white crappie, and channel and flathead catfish.
  - *Objective 15.* Use land use control procedures to manage the small, shallow ponds on IAAAP for amphibian habitat.
- Goal: Maintain fish and wildlife populations at optimal levels in accordance with species priorities, population ecology, population health considerations, and habitat capacities.
  - *Objective 6.* Maintain small game and furbearers within habitat carrying capacities.
  - *Objective 7.* Manage fisheries resources to maintain a harvestable surplus and use recreational harvest to manage game fish populations.
  - *Objective 11.* Protect small and shallow water areas as reptile and amphibian habitats; ensure ample cover and resources exist for snakes, lizards, and land turtles to satisfy food and cover requirements; and educate installation personnel on benefits of reptiles, especially snakes.
- Goal: At a minimum, sustain residential populations of endangered, threatened, or special status species and their habitats, with the long-term goal of conserving listed species and their habitats in accordance with specific Recovery Plans and the ESA.
  - *Objective 2.* Implement Indiana and northern long-eared bat management prescriptions specified in the Endangered Species Management Plan.

Measures, in the form of suitable screening benchmarks, are the ecological screening values (ESVs) discussed in Step 2. Assessment endpoints and measures are presented in Table 3-1 and are detailed below:

- Survival, growth, and reproduction of aquatic plants. Aquatic plants are important for maintaining fish and herpetofauna habitats, particularly the formation of riparian vegetative buffers for travel and dispersal corridors, egg-laying substrates, and habitat for larvae and fry (Stantec 2018).

- Survival, growth, and reproduction of sediment infauna populations (benthic invertebrates, amphibians, and fish). Although invertebrates are not managed directly at IAAAP, they serve as a food source for higher trophic-level consumers, including sport fish. Maintenance and protection of fish and amphibian habitat is an IAAAP management goal (Stantec 2018).
- Survival, growth, and reproduction of aquatic piscivores (belted kingfisher). Belted kingfisher are a representative species for piscivorous birds, such as the bald eagle which is transient in IAAAP and a state-listed species (Stantec 2018).
- Survival, growth, and reproduction of piscivorous mammals (mink). Mink are a representative species for small furbearers, which are managed at IAAAP (Stantec 2018), and the piscivore feeding group.
- Survival, growth, and reproduction of sensitive species within the stream habitats (Indiana bat). Indiana bats are an endangered species and, for ERA purposes, are also representative for an additional threatened species, the long-eared bat, both present at IAAAP with management goals (Stantec 2018).

SECTION 4

Screening Level Exposure Assessment and Risk Calculation (Step 2)

The screening level exposure assessment and risk calculation is the final step in the SLERA, corresponding to Step 2 in the USEPA process. The goal of this step is to profile the spatial and temporal patterns and magnitude of exposure for detected chemicals in relation to the assessment endpoints and risk questions, and present an analysis of the lines of evidence for existing and potential adverse effects of site-related contamination on the assessment endpoints. In this step, the maximum exposure concentrations for each medium in each watershed are compared with corresponding conservative ESVs to derive conservative screening risk estimates. For example, maximum medium-specific concentrations for all detected chemicals are compared to risk-based screening values without considering the fraction of time a receptor forages within the respective watershed. If ESVs are unavailable, then the chemicals are carried forward for further evaluation. COPECs are identified at this final step of the SLERA.

4.1 Exposure Assessment

The principal activity associated with the exposure assessment was estimating chemical concentrations in applicable media, termed exposure point concentrations (EPCs), to which the receptors might be exposed. This was accomplished by selecting appropriate sets of available analytical data using a set of criteria (e.g., validation status and sampling date). After the analytical data sets were selected, EPCs were calculated as a particular point on the distribution of concentrations. At the screening level, the EPC is the maximum detected concentration (MDC), per the guidance for Step 2 in USEPA (1997). For those chemicals with reported detection limits above a screening value, the maximum reported detection limit was used as the EPC. Chemicals with no detected concentrations or no established ecological screening levels are not included in the screening and are discussed in Section 5.6.

Receptors such as benthic macroinvertebrates, aquatic plants, and fish are exposed primarily through direct contact with sediment and/or surface water. The exposure estimates were assessed based on chemical concentrations in applicable media to which the receptors might be exposed.

Maximum detected concentrations initially were used in the SLERA to conservatively estimate the potential chemical EPCs for the ecological receptors selected to represent the assessment endpoints. The EPCs were compared with the corresponding ESVs to derive conservative screening risk estimates, presenting “worst-case” scenarios for the chemicals.

COPECs were identified using the HQ method. HQs were calculated by dividing the EPC (the maximum for detected chemicals) by the corresponding screening value. Chemicals with screening value-based HQs greater than or equal to 1 are considered COPECs. Chemicals for which toxicological data were not available were not identified as COPECs but are addressed in the uncertainty section.

For analytes that failed the screening (HQ greater than 1), additional evaluation was completed as part of the refinement step of the SLERA. At this step, consideration was given to additional weights of evidence (WOEs). Estimates of exposure for these receptors may be represented as concentrations of COPECs in abiotic media or tissue residue. Therefore, depending on availability of data, an upper confidence limit (UCL)–based EPC or the mean of observed concentrations of a COPEC were selected as a suitable EPC.

4.2 Screening Level Risk Calculation

The following sections discuss the determination of available analytical data, ESVs, screening risk calculations, and general ERA uncertainties.

4.2.1 Available Analytical Data

Sediment and surface water data is available for IAAAP between 1981 and 2019. The available data set is comprehensive enough (that is, provides adequate spatial distribution) to evaluate the four watersheds in this ERA. As summarized in Tables 1-1 through 1-4, samples were collected in the appropriate locations to assess potential source impacts to each of the four watersheds.

Analytical data evaluation involved gathering available site data and identifying a dataset of acceptable quality for the SLERA. Analytical data used in the 2004 BERA and collected during RI events after the 2004 BERA were reviewed. All of the surface water and sediment sample locations were visually evaluated to identify which samples were collected from perennial features. As stated in the final *Site-specific Worksheets for Watersheds of the Uniform Federal Policy–Quality Assurance Project Plan for Remedial Investigation at Iowa Army Ammunition Plant* (CH2M 2018), only locations that are covered with water year-round are considered sediment or surface water locations for RI assessment. In addition, if multiple samples were collected from the same location, then only the most recent sample data was selected for the ERA. In particular, surface water data collected in the early 1990s was excluded if more recent surface water data were available from a given location. Although some of the remaining data selected for the watershed-based ERA are older, this older data is still considered acceptable for use. As stated in the UFP-QAPP (CH2M 2017), "Older data (i.e., data collected prior to 2012) may be used in the human health risk assessments if they are still representative of the site (i.e., groundwater flow is slow), chemicals have properties where there would not be a significant reduction in concentrations over time (e.g., metals), or data are conservative for site conditions." The majority of environmental sites at the IAAAP are not currently operational, as described in Tables 1-1 through 1-4. Due to a lack of continuing sources, historical concentrations in surface water and sediment are expected to have remined stable or even decreased due to natural attenuation processes. Therefore, the assumptions in the final UFP-QAPP still hold. Note, this use of older data may slightly deviate from the approach used in risk assessment for individual IAAAP sites, as those sites may rely on "newer" data that was collected to address specific data gaps for those individual sites.

Analytical data were further evaluated using the following procedures:

- Unqualified results were considered detected.
- A value reported as "B" (blank contamination) or "J" (estimated) qualified was treated as a detected value.
- "U" (undetected) qualified results were treated as nondetected values.
- "R" (rejected) qualified results were not included in the SLERA data set.

For samples with duplicate analyses, the higher of the two concentrations was used when both values were detects or when both values were nondetects. In cases where one result was a detect and the other a nondetect, the detected value was used in the assessment. For nondetected results, the sample quantitation (reporting) limit was used to represent the concentration. When calculating statistics (such as arithmetic mean), the sample quantitation limit was used by ProUCL for nondetected results.

Sediment analytical data used in this ERA are summarized in Tables 4-1, 4-2, 4-3, and 4-4 for Skunk River, Long Creek, Brush Creek, and Spring Creek, respectively. Surface water analytical data used in this ERA are summarized in Tables 4-5, 4-6, 4-7, and 4-8 for Skunk River, Long Creek, Brush Creek, and Spring Creek, respectively. Sample locations are presented by watershed: Skunk River sample locations are shown on Figure 4-1; Long Creek sample locations are shown on Figures 4-2 and 4-3; Brush Creek

sample locations are shown on Figures 4-4 through 4-6; and Spring Creek sample locations are shown on Figures 4-7 and 4-8.

4.2.2 Ecological Screening Levels

The ESVs that were used in the ERA are summarized in Table 4-9 for sediment and Table 4-10 for surface water. Per the final UFP-QAPP (CH2M 2017), the ESVs for IAAAP were selected using a hierarchical approach.

The ESVs for sediment were selected using the following hierarchy:

- USEPA Region 4 Ecological Screening Values (2018b)
- USEPA Region 5 Ecological Screening Levels (2003)
- USEPA Region 3 Biological Technical Assistance Group Screening Values for Freshwater Sediment (2006a)

The ESVs for surface water were selected using the following hierarchy:

- Iowa Ambient Water Quality Criteria Chronic (AWQC) (IAC Chapter 61)
- USEPA National Recommended Water Quality Criteria—Aquatic Life Criteria (2020)
- USEPA Region 4 Ecological Screening Values (2018b)
- USEPA Region 5 Ecological Screening Levels (2003)
- USEPA Region 3 Biological Technical Assistance Group Screening Values for Freshwater Sediment (2006a)

The final UFP-QAPP (CH2M 2017) and 2004 BERA did not include USEPA Region 4 ESVs because the 2018 values were published after they were finished. For this ERA, they were selected over the USEPA Region 5 and USEPA Region 3 ESVs, since the USEPA Region 4 values are more current.

4.2.3 Background Threshold Values

USEPA's (2002) *Role of Background in the CERCLA Cleanup Program* guidance states that risk management for CERCLA sites should account for the influence of natural and anthropogenic background conditions. Background concentrations for natural and anthropogenic chemicals are also used for comparison to site data to support the identifications of a site-related release. Background threshold values (BTVs) were developed for sediment and surface water specific to three of the watersheds at IAAAP: Brush Creek, Long Creek, and Spring Creek (CH2M 2020). BTV calculations are documented in the draft *Evaluation of Background Concentrations of Metals in Sediment and Surface Water* (CH2M 2020). BTVs were not developed for the Skunk River watershed due to the limited number of IAAAP sites in this watershed and because there is no indication that sites in this watershed impacted sediment and surface water (CH2M 2018). For the purposes of this ERA, BTVs of the other three watersheds were averaged to generate BTVs for Skunk River.

BTVs are listed in Tables 4-11 and 4-12.

The selected ESVs and BTVs were used to assess the sediment and surface water data at the IAAAP using the decision logic below.

- If the maximum concentration(s) in a medium does not exceed the ESV, the chemical will not be considered a COPEC.
- For inorganic chemicals, if the maximum concentration is greater than the ESV, the chemical is compared to background concentrations. If the maximum concentration is greater than the ESV and the watershed-specific BTV, the chemical will be identified as a COPEC.
- In instances where only background concentrations are available (i.e., for inorganics without ESVs), if the site concentration exceeds the BTV, the chemical will be selected conservatively as a COPEC.

- If neither an ESV nor background concentration is available (i.e., for organics without ESVs), the chemical will be selected conservatively as a COPEC depending upon rationale and potential former use.

4.2.4 Screening Risk Calculation

The SLERA risk calculation is a conservative estimation of the potential for adverse effects to ecological receptors. All detected chemicals in each watershed and exposure medium were evaluated in the SLERA risk calculation.

The screening level HQs were calculated using the following equation:

$$HQ = \frac{Maximum\ detected\ concentration\ (mg/kg\ or\ \mu g/L)}{ESV\ (mg/kg\ or\ \mu g/L)}$$

Chemicals with HQs greater than or equal to 1 or for which ESVs were not available were identified as COPECs. Chemicals with HQs less than 1 are not considered to pose an unacceptable adverse effect to ecological receptors and are eliminated from further evaluation. Each COPEC was then subjected to a WOE evaluation in order to place the results into proper context and make one of the following decisions: (1) NFA is warranted, (2) further evaluation is warranted, or (3) additional data are required. WOE topics can include site size, nutrient considerations, exposure considerations, frequency of detection, magnitude of HQ, conservativeness of the ESV, and comparisons using measures of central tendency (UCL and/or mean) in place of the MDC.

4.2.4.1 Step 2 Results

Sediment and surface water data were compiled and compared to respective ESVs. Following comparison to ESVs, inorganic chemicals were then compared to respective BTVs. Chemicals with MDCs exceeding respective ESVs (and BTVs for inorganic chemicals), were retained as COPECs. Tables 4-13, 4-14, 4-15, and 4-16 present the Step 2 screening risk calculation results for sediment in Skunk River, Long Creek, Bush Creek, and Spring Creek, respectively. Tables 4-17, 4-18, 4-19, and 4-20 present the Step 2 screening risk calculation results for surface water in Skunk River, Long Creek, Bush Creek, and Spring Creek, respectively. To provide a more complete view of the watersheds, Tables 1-1 through 1-4 present the chemicals of potential concern identified in the Skunk River watershed, Brush Creek watershed, Long Creek watershed, and Spring Creek watershed, respectively, during the site-specific RI evaluations.

MDCs for constituents that exceeded respective sediment ESVs (and BTVs, if applicable) for sediment and surface water are summarized in Tables 4-21 and 4-22, respectively. For comparison and to provide a more complete view of the watersheds, Tables 1-1 through 1-4 present the chemicals of potential concern identified in the Skunk River watershed, Brush Creek watershed, Long Creek watershed, and Spring Creek watershed, respectively, during the site-specific RI evaluations.

4.2.4.2 Weight of Evidence Evaluation

- The initial screening evaluation resulted in a list of COPECs for each watershed. The first screening step in ERAs are inherently conservative, and as a result further evaluation is needed to determine whether the initial list of COPECs should be carried forward to the BERA. As a result, these COPECs were evaluated further by calculating a 95 percent UCL-based EPC and mean-based EPC and then comparing them to the same ESVs (and BTVs) as in the initial step. If ESVs for a COPEC were not available from USEPA Regions 4, 3, or 5, additional sources of screening levels were consulted, according to the following hierarchy:

- Los Alamos National Laboratory (LANL) EcoRisk Database Lowest Observed Effect Concentration (LOEC) (2017)

- Texas Commission of Environmental Quality (TCEQ) Ecological Benchmark Tables (2018)

706 – Freshwater chronic benchmark (surface water) and sediment benchmark

707 – Freshwater acute benchmark (surface water) and sediment second effects level

708 Other lines of evidence in the WOE evaluation included an evaluation of frequency of detection,
709 frequency of exceedance, and magnitude of exceedance. Tables 4-21 through 4-28 provide the WOE
710 evaluation for sediment and surface water by watershed.

711 This comparison resulted in the following COPECs being retained for further evaluation for sediment:

	Skunk River	Long Creek	Brush Creek	Spring Creek
Inorganics				
Copper	—	—	—	X
Silver	—	—	—	X
Explosives				
2,4,6-Trinitrotoluene	—	—	X	—
2,6-Dinitrotoluene	—	—	X	—
2-Amino-4,6-dinitrotoluene	—	—	X	—
4-Amino-2,6-dinitrotoluene	—	—	X	—
HMX	—	—	X	—
RDX	—	—	X	—

No chemicals were retained for sediment in the Skunk River or Long Creek watersheds. No COPECs were retained for surface water in any watershed.

712 For surface water, no COPECs were retained for surface water in the Skunk River, Long Creek, Brush
713 Creek, or Spring Creek watersheds. As surface water is a dynamic medium, there is potential for
714 concentrations from older samples to be more conservative than current site conditions as
715 contaminants may have attenuated (that is, volatilized, degraded, sorbed, or diluted) or migrated
716 further downstream.

717 4.3 Recommendation for Scientific Management Decision 718 Point 1

719 Following Step 2, the first scientific management decision point (SMDP) occurs. This SMDP is intended to
720 communicate the findings of the SLERA and to determine which COPECs, endpoint species, and
721 exposure pathways should be carried forward to Step 3. Based on the results of the WOE the following
722 chemicals were retained for further evaluation in Step 3.

723 • For the Brush Creek watershed, explosives (2,4,6-trinitrotoluene, 2,6-dinitrotoluene, 2-amino-4,6-
724 dinitrotoluene, 4-aminio-2,6-dinitrotoluene, HMX, and RDX) were retained as sediment COPECs; no
725 surface water COPECs were retained for this watershed. Table 1-2 provides a summary of potential
726 sources of explosives to the watershed.

727 • For the Spring Creek watershed, copper and silver were retained as sediment COPECs; no surface
728 water COPECs were retained for this watershed. Table 1-4 provides a summary of potential sources
729 of explosives to the watershed.

- While there were some chemicals in sediment and surface water that exceeded respective ESVs within the Skunk River and Long Creek watersheds, the WOE evaluation found these chemicals are not likely to pose unacceptable adverse effects to ecological receptors, and as a result no further ecological risk evaluation is warranted for these two watersheds.

SECTION 5

Baseline Ecological Risk Assessment (Step 3)

This section corresponds to Step 3 of the eight-step ERA process and the refinement of the COPECs, in which the conservative assumptions used in the SLERA are refined and risk estimates are calculated using the same ECSM. Section 2 of this document provides a summary of the ERA methods, while Section 1 of this document summarizes the watershed approaches used in previous risk assessments. The COPEC refinement is divided into two categories—a refinement of the direct exposure to aquatic organisms and dose-based food-web modeling to higher trophic-level wildlife. The BERA also includes the risk description. The SLERA identified a list of COPECs by watershed in Step 2 and recommended that they be carried forward to a BERA. The BERA begins with a refinement of the COPECs in which the conservative assumptions originally used in the SLERA are refined, and the risk estimates are recalculated using the same ECSM. Additional lines of evidence also are addressed in a WOE approach as part of the refinement. This section also includes an assessment of uncertainty. It documents the major sources of uncertainty associated with the estimation and description of potential adverse effects. At the conclusion of Step 3, SMDP 2 is completed.

5.1 Problem Formulation

This section summarizes the SLERA refinements and BERA methodology to further evaluate COPECs identified in the SLERA.

The problem formulation provided in the SLERA (Section 3, Screening Level Ecological Risk Assessment Problem Formulation) is comprehensive and applies to both the SLERA and BERA portions of this ERA. Additional exposure, toxicity, and risk evaluation refinements that are used in the BERA to further focus the risk assessment are summarized below and discussed in the following subsections:

- EPCs are determined using statistical evaluations where sufficient data are available.
- Receptor-specific exposure parameters (for example, considering foraging areas and migration habits) are used in the food-chain uptake model to provide more realistic estimates of exposure.
- Risk estimates are completed on a receptor (or functional group)-specific basis to provide information on exposure pathways that may be driving adverse effects and to provide a more realistic estimate of the overall potential for adverse effects to ecological populations using the watershed.
- Both low and high ESVs and TRVs are used, where available, to provide a range of hazard estimates for each receptor group. ESVs and TRVs were selected to be applicable to the common species observed at IAAAP.
- A WOE approach is used to weigh potential adverse effects and provide a defensible rationale for the determination of chemicals of ecological concern (COECs) that may be recommended for further evaluation.

5.2 Analysis

The analysis phase links the problem formulation phases (Section 3, Screening Level Ecological Risk Assessment Problem Formulation, and 5.1, BERA Problem Formulation) with the risk characterization phase (Section 5.3, BERA Risk Characterization), and consists of the technical evaluation of ecological and chemical data to determine potential for ecological exposure and effects. The analysis phase includes the exposure characterization and the ecological effects characterization. These two components are used to evaluate the relationships among receptors, potential exposures, and potential

effects. The results provide the information necessary to estimate potential adverse effects to the representative species under the conditions defined for each watershed.

The exposure characterization is used to evaluate the relationship between receptors at the watershed and COPECs. The methods used to refine exposure estimates, including receptor-specific exposure models, site-specific data, and calculation of EPCs, are described in the following subsections.

To support evaluation of exposure, exposure models were used. The exposure model describes the relationships and equations used to estimate how much of a given chemical in a given medium is being taken up by the receptor through a given exposure route. These relationships can be simple or complex, depending on the receptor involved and the number of exposure routes being evaluated. Both concentration-based and dosage-based models were used.

5.2.1 Direct Exposure (Concentration-based Exposure Comparison)

The concentration-based comparison used in the BERA is the same as was used in the SLERA, whereby exposure is expressed as the concentration of each chemical in the medium to which the receptor is most likely exposed. This is expressed as the refinement screening value (RSV); less conservative screening values based on the lowest observed adverse effect level (LOAEL) of a chemical and collected by USEPA Region 4 (2018b). The ecological groups for which this exposure comparison is used are as follows:

- Aquatic and benthic plants (sediment)
- Benthic and epibenthic macroinvertebrates (sediment)
- Aquatic organisms including aquatic plants, water column invertebrates, amphibians, and fish (surface water)

The potential for adverse effects to lower trophic-level receptors was calculated using a conservative estimate of the mean chemical concentration as the EPC. EPCs were calculated using ProUCL Version 5.1. If a conservative estimate of the mean EPC could not be calculated, the arithmetic mean concentration was used as the EPC.

Nondetected chemicals were excluded from further consideration and discussed within the uncertainties section 5.6. Additionally, those analytes that were detected but lacked toxicological data will be identified as contributing to adverse effects though they were considered an uncertainty. A lack of toxicological data demonstrates that these chemicals historically have not been identified as significant drivers of ecological adverse effects, and it is unlikely these chemicals contribute to adverse effects. Likewise, nutrients, including calcium, magnesium, potassium, and sodium are excluded from further consideration in Step 3.

5.2.2 Food-chain Transfer (Dosage-based Exposure Model)

The general exposure model to be used for birds and mammals is based on exposure to contaminants through multiple pathways, including sediment, surface water, and food items. This exposure model applies to all four of the watersheds evaluated in this ERA. To address these multiple pathways, a food-chain uptake model is used. Exposure estimates for each representative species are generated using the following:

- EPCs for abiotic media of concern
- Receptor-specific exposure factors (or life history parameters)
- Area use and migration factors
- Bioaccumulation potential in food items

The end product of the BERA exposure estimate is a dosage (milligrams per kilogram receptor body weight per day) rather than a medium concentration (as was used for the SLERA). This is a function of both the multiple pathway approach and the typical methods used in toxicity testing for birds and

mammals. The dietary dose (intake) for each upper trophic-level receptor was calculated using the following formula from Suter et al. (2000):

$$Et = [[Sj * Ps * FIR] + [Bij * Pi * FIRDW] + [SWj * WIR]]*AUF*MF$$

Where:

E_t	=	total dietary exposure (mg/kg per day)
S_j	=	concentration of chemical (*j*) in soil or sediment (mg/kg dry weight)
Ps	=	sediment ingestion as proportion of dry-weight diet
FIR_{DW}	=	species-specific food ingestion rate (kilogram [kg] food per kg body weight per day—dry-weight basis)
B_{ij}	=	concentration of chemical (*j*) in biota type (*i*) (mg/kg dry weight)
P_i	=	proportion of biota type (*i*) in wet-weight diet
SW_j	=	concentration of chemical (*j*) in surface water (milligrams per liter)
WIR	=	species-specific water ingestion rate (liters of water per kg body weight per day)
AUF	=	Area use factor (fraction of foraging range)
MF	=	Migration factor (fraction of year)

5.2.3 Model Parameterization

To apply the above general exposure model, which applies to all of the watersheds in this ERA, the following model parameters must be defined. These parameters are summarized below and further detailed in this section.

- Wildlife Exposure Parameters. The specific life history parameters required to estimate exposure of bird and mammal receptors to the COPECs include body weight, food ingestion rate (FIR), drinking water ingestion rate (WIR), and dietary components and proportion of the overall diet represented by each major food type (P_i), including incidental ingestion of sediment (P_s). The parameters are presented in Table 5-1. Belted kingfisher and mink, which consume aquatic vegetation, benthic invertebrates, fish, and sediment incidentally, and Indiana bats, which consume aquatic invertebrates and sediment incidentally, were considered for aquatic-based exposures. Belted kingfisher and mink are predominately confined to the Lange and River Streets' canals, and the Indiana bat has been recorded feeding and roosting in IAAAP (Stantec 2018). The Indiana bat, which consumes aquatic invertebrates, and incidentally, sediment, forages on IAAAP. Aquatic-based exposure designations were necessary for calculating EPCs, as described in the following bullet.

- Exposure Point Concentrations. Because wildlife are mobile, traveling and experiencing exposure over the range of habitats they occupy, their exposure is often described by site- or habitat-wide representation of the chemical data in areas they inhabit (Suter et al. 2000). For the BERA, the UCL was used as the basis of all abiotic media EPCs. ProUCL Version 5.1 was used to calculate the UCLs. ProUCL outputs are provided in Appendix B for sediment and surface. In some cases, a UCL could not be calculated because of too few detections or insufficient samples.

- Bioaccumulation. Dietary items for which tissue concentrations of upper trophic-level receptors were modeled included plants, invertebrates, and fish. The uptake of chemicals from the abiotic media was based upon mean literature-derived bioconcentration factors or bioaccumulation factors (BAFs) from the literature or log K_{ow}-based linear regression models. If site-specific tissue data, literature values, or reliable regression models were not available for a given chemical, a default bioaccumulation value of 1 was used. Aquatic bioconcentration factors, biota-sediment accumulation factors, and BAFs are presented in Table 5-2.

- Area Use Factor. Many wildlife species are highly mobile, covering relatively large areas in search of food, water, and shelter. As such, the exposure that individual receptors experience depends on the

amount of time they spend at a contaminated site. The AUF is a ratio of the size of a site (or exposure area) relative to an animal's foraging range using the following equation. This value is incorporated in the exposure model to give a more realistic estimation of overall exposure.

$$AUF = \frac{Exposure\ \ Area}{FR_x}$$

where:

AUF = Area use factor
Exposure Area = Contaminated area or habitat type (acres)
FRx = Foraging range for target species *x* (acres)

AUFs were assumed to be 1.

5.2.4 Ecological Effects Characterization

The ecological effects characterization consists of an evaluation of available toxicity or other effects information that can be used to relate the exposure estimates to a level of adverse effects. Stressor-response (i.e., effects) data that can be used to evaluate ecological potential adverse effects resulting from chemical exposures comprise three general categories: literature-derived or site-specific single-chemical toxicity data, site-specific ambient media toxicity tests (i.e., bioassays), and site-specific field surveys (Suter et al. 2000). No site-specific field surveys were conducted as part of this ERA.

Single-chemical toxicity data found in the literature were used as the primary basis for the BERA risk estimates and consist of toxicity benchmarks and TRVs. Toxicity benchmarks are concentrations of chemicals in media (sediment, soil, or surface water) corresponding to effects levels and are reported in mg/kg or µg/L. TRVs are dosage-based effects levels and are reported as mg/kg-day. The specific format of toxicity values for each receptor group being evaluated in this ERA is provided below, along with the sources of the values. Values were generally selected in the hierarchical order that the sources are listed. If there were two sources available that identify a toxic effect for a chemical, and they were considered of equivalent quality from a scientific standpoint and of equivalent applicability to the modeled wildlife species, then the source with the more conservative values was used.

Where possible, the ingestion TRVs for dietary exposures used in the BERA (MWH 2004) were selected. When needed, ingestion TRVs were derived for each chemical evaluated in the ERA. TRVs were derived for both mammalian and avian upper trophic-level receptors, the only two taxonomic groups for which sufficient toxicological information is generally available for the range of chemicals evaluated. Toxicological information from the literature for wildlife species most closely related to the receptor species were used, where available, but were supplemented by laboratory studies of nonwildlife species (such as laboratory mice) where necessary, as is standard procedure. Species-specific uptake and exposure factors, such as body weight and dietary composition, are included in the food-web modeling to make the exposure model species-specific to the targeted receptors. The ingestion TRVs are expressed as milligrams of the chemical per kilogram body weight of the receptor per day.

Survival, growth, and reproduction was emphasized as toxicological endpoints because they are the most ecologically relevant to maintaining viable populations, as prioritized in the IAAAP *Natural Resource Management Plan* (Stantec 2018), which is summarized in Section 3.2.4, and because they are generally the most studied toxicological endpoints for ecological receptors. Endpoints based upon reproduction were generally preferred to those based upon growth, which were preferred to those based upon survival. If several chronic toxicological studies were available from the literature, the most appropriate study were selected for each receptor species based upon study design, study methodology, study duration, study endpoint, and test species. TRV values are provided in Tables 5-3 and 5-4.

Ingestion TRVs were derived for both chronic no observed adverse effect level (NOAEL) and chronic LOAEL endpoints. The TRVs used in the BERA are presented in Tables 5-3 and 5-4 for mammals and birds, respectively.

5.3 Risk Characterization

The risk characterization evaluates the evidence linking exposures to COPECs with their potential ecological effects on the representative species identified for the watersheds on the IAAAP site. This evaluation was completed through the integration of information gathered in the SLERA and BERA problem formulation, analysis, and other lines of evidence. For this ERA, the evidence evaluated consisted of measured chemical concentrations in abiotic media (e.g., sediment and surface water), measured and modeled concentrations in biota (for food-chain uptake), exposure estimates for representative species, toxicity information obtained from the literature, quantitative risk estimates, qualitative evaluations of tissue residue levels. The risk characterization includes three components: risk estimation, risk description, and uncertainty analysis. These three components were used together to provide supporting information for SMDP 2 where final COECs are identified.

5.4 Risk Estimation

The risk estimation phase focuses primarily on quantitative methods to evaluate the potential for adverse ecological effects. The results of the quantitative risk estimation are represented as HQs, which were developed for two types of comparisons using the following equations.

The primary means of characterizing ecological adverse effects for wildlife is to determine the ratio of the estimated chemical exposure level or dose for the wildlife receptor with the COPEC-specific TRV. COPECs are selected based upon a comparison of maximum exposure doses from site-specific food-chain modeling with the NOAEL-based ingestion TRV. Those chemicals with an exposure dose exceeding the NOAEL-based ingestion TRV are further evaluated using a conservative estimate of the mean and less conservative food-chain assumptions. HQs can be calculated to quantitatively characterize these potential ecological adverse effects. The following equation is used:

$$HQ = \frac{E_j}{TRV}$$

where:

HQ = Ecological hazard quotient (unitless)
E_j = Estimated COPEC exposure (mg/kg$_{bw}$-day)
TRV = Toxicity reference value (mg/kg$_{bw}$-day)

The primary means for quantifying ecological risk for direct exposures for aquatic receptors is to determine the ratio of the estimated COPEC exposure levels for the endpoint species of concern with the COPEC-specific ecological benchmark criterion:

$$HQ = \frac{EPC}{ESV}$$

where:

HQ = Ecological hazard quotient (unitless)
EPC = Exposure point concentration (mg/kg or mg/L)
ESV = Ecological screening value criterion (mg/kg or mg/L)

Conclusions are made as to whether or not there is a reasonable potential for unacceptable ecological adverse effect, and if there is a potential for unacceptable ecological adverse effects, the magnitude of

the potential for adverse effects associated with the identified COECs. A specific magnitude of exceedance is not equated to a specific adverse effect, but contributes to a general understanding of the potential for adverse effects to the receptor. For example for a particular chemical and receptor combination, the ESV is based on a NOAEL and the RSV on a LOAEL. A large exceedance of the RSV, such as by an order of magnitude, implies that adverse effects are likely to occur. The results of the completed BERA (Step 7) are used to make any necessary risk management decisions (Step 8) related to current or future adverse ecological effects. Possible decisions include the following:

- There is adequate information to conclude that no significant ecological adverse effects exist. The assessment should stop at Step 7.
- There is adequate information to conclude that ecological adverse effects warrant remedial action. Whether or not remedial actions are taken (and specific actions are taken) will depend upon a number of risk management factors such as the potential impact of the remedial action itself on the habitats and biota present. This analysis would occur as part of Step 8.
- There is not adequate information to estimate adverse effects or the risk estimate is believed to be too conservative or uncertain to recommend remediation. The assessment should be refined.

5.4.1 Site Risk Estimation Results (Direct Exposure)

No surface water COPECs were identified in any watershed and carried into the BERA.

Four COPECs were identified in sediment for the Brush Creek watershed and two COPECs were identified in the Spring Creek watershed and were carried on into the BERA. No COPECs were identified for sediment in the Long Creek or Skunk River watersheds. Additional discussion of sediment COPECs identified for the Brush Creek and Spring Creek watersheds is provided below.

5.4.1.1 Brush Creek Watershed

Table 5-5 presents the comparison of 95 percent UCL COPEC concentrations in Brush Creek sediment to the USEPA Region 4 ecological RSVs (USEPA 2018b). Based on their comparison to RSVs, the following chemicals were retained for further evaluation in the Risk Description and WOE evaluation:

Analyte Name	95% UCL HQ (ESV-based)	95% UCL HQ (RSV-based)	Mean HQ (RSV-Based)	Background Threshold Value	COPEC?
Explosives (µg/kg)					
2,4,6-Trinitrotoluene	24	6	2	NA	Yes
2-Amino-4,6-dinitrotoluene	18	6	3	NA	Yes
4-Amino-2,6-dinitrotoluene	15	6	3	NA	Yes
RDX	27	6	3	NA	Yes

5.4.1.2 Spring Creek Watershed

Table 5-6 presents the comparison of 95 percent UCL COPEC concentrations in Spring Creek sediment to the USEPA Region 4 ecological RSVs (USEPA 2018b). Based on their comparison to RSVs, copper and silver exceeded their respective RSVs and were retained for further evaluation in Risk Description and WOE evaluation.

Analyte Name	95% UCL HQ (ESV-based)	95% UCL HQ (RSV-based)	Mean HQ (RSV-based)	Background Value	COPEC Flag (Y/N)
Inorganics (mg/kg)					
Copper	9	2	1	21	Yes
Silver	13	6	2	0.7	Yes

968

969 5.4.2 Site Risk Estimation Results (Food-Web Exposure)

970 As discussed in Section 5.2.2, exposures for wildlife receptors were estimated through food-web
971 modeling (dietary dose estimates) using site-specific abiotic media.

972 Estimated dietary doses of COPECs were compared to TRVs to evaluate the potential for adverse effects
973 to wildlife receptors that use IAAAP. The following is a summary of the exposure estimates and
974 screening results for the Brush Creek and Spring Creek watersheds:

975 5.4.2.1 Brush Creek Watershed

976 • Mink: The estimated dose of each COPEC does not exceed the respective NOAEL and LOAEL TRVs
977 (Table 5-7).

978 • Indiana bat: The estimated dose of each COPEC does not exceed the respective NOAEL and LOAEL
979 TRVs (Table 5-8).

980 • Belted kingfisher: The estimated dose of each COPEC does not exceed the respective NOAEL and
981 LOAEL TRVs (Table 5-9).

982 5.4.2.2 Spring Creek Watershed

983 • Mink: The estimated dose of each COPEC does not exceed the respective NOAEL and LOAEL TRVs
984 (Table 5-10).

985 • Indiana bat: The estimated dose of silver does not exceed the respective NOAEL and LOAEL TRVs.
986 The estimated dose for copper resulted in a LOAEL-based HQ 1; (Table 5-11).

987 • Belted kingfisher: The estimated dose of silver does not exceed the respective NOAEL and LOAEL
988 TRVs. The estimated dose for copper resulted in a LOAEL-based HQ of 0.6 (Table 5-12).

989 5.5 Risk Description

990 The risk description is the part of the ERA in which the risk assessors integrate and interpret the
991 available information into conclusions about adverse effects to the assessment endpoints. The
992 integration and interpretation of information is qualitative, given the measures of effects used to
993 evaluate risk and the risk estimation technique employed. Essentially, the risk description is a technical
994 narrative supporting the hazard estimates and a critical interpretation of the ecological significance of
995 those estimates.

996 The risk description has two primary elements. The first is the ecological risk summary, which
997 summarizes the results of the risk estimation and discusses the uncertainties associated with the
998 integral steps of the ERA. This section contains the WOE analysis, which summarizes the results of the
999 risk estimation and uncertainty analysis and assesses confidence in the risk estimates through a
1000 discussion of the different lines of evidence. The second element is the interpretation of ecological
1001 significance, which may be described in terms of the spatial and temporal extent of effects and, when
1002 possible, as an estimation of the recovery potential once the stressor is removed (Norton et al. 1992).

Another element, a discussion of the effect of additional data or analyses on uncertainty, also is provided.

5.5.1 Risk Description and Weight of Evidence Evaluation

Not all of the watershed risk estimates with HQs exceeding 1, as provided in Section 5.4, Risk Estimation, are ultimately ecologically meaningful. The risk description component of the BERA includes an evaluation of the lines of evidence supporting or refuting the risk estimates and an interpretation of the significance of the adverse effects on the identified assessment endpoints. To provide confidence in any decision-making for ecological resources within the IAAAP watersheds, the potential effects on plant, aquatic, and wildlife communities are assessed using an approach that considers multiple lines of evidence collectively, in accordance with *Guidelines for Ecological Risk Assessment* (USEPA 1998b). The additional lines of evidence considered at this stage include the following:

- Consideration of the hazard contribution from natural background concentrations
- Considerations of outlier(s) in the dataset
- Ecological relevance of exceedances
- Frequency and magnitude of exceedances
- Less conservative screening values

5.5.1.1 Brush Creek Sediment

As presented in 5.4.1, four explosive chemicals (2,4,6-trinitrotoluene, 2-amino-4,6-dinitrotoluene, 4-amino-2,6-dinitrotoluene, and RDX) were carried forward into the WOE evaluation step of the BERA based on comparison to respective RSVs. The resulting HQs (based on comparison to RSVs) were only around 6 for each chemical with mean-based HQs between 2.0 and 3.2 (Table 5-5). Less conservative screening values were evaluated for the four explosives (TCEQ 2020) (Table 5-13). These values were based on equilibrium partitioning coefficients using the following equation:

$$SQB = WQB * [(foc * Koc) + ((1 - fsolids) \div fsolids)]$$

Where:

SQB = sediment quality benchmark in mg/kg dry weight
WQB = Water quality benchmark mg/L
*f*oc = fraction of organic carbon
*f*solids = fraction of solids

When compared to these benchmarks all 95 percent UCL-based HQs were less than 1 (Table 5-13). As presented in 5.4.2, the TRV-based HQs were also all less than 1 for all receptors evaluated indicating that adverse effects to upper trophic receptors from exposure to explosives in Brush Creek watershed are unlikely.

5.5.1.2 Spring Creek Sediment

As presented in Section 4.3, copper and silver in Spring Creek sediments were carried forward into the WOE evaluation step of the BERA based on comparison to respective RSVs. The 95 percent UCL HQs (RSV-based) were 1.9 and 6.0 for copper and silver, respectively. However, mean HQs were less than 1 for copper and 1.6 for silver. In addition, the low frequency of exceedance of the respective RSVs and the low magnitude of exceedance of the RSVs indicate that copper and silver are not widespread throughout the watershed. The food-web modeling also demonstrated that adverse effects are not likely for upper trophic receptors, represented by the mink and belted kingfisher. The LOAEL-based HQ for the Indiana bat was 1.1. An outlier analysis was performed on the dataset. As shown in a Q-Q plot (Figure 5-1) and presented in Table 5-14, four samples were identified as potential outliers. For conservativeness, only one sample, the sample with the anomalous 1600 mg/kg was eliminated and the 95% UCL was recalculated (Appendix B). The resulting 95% UCL was 124 mg/kg which is below the RSV

and when the food-web model for the Indiana bat was rerun with the refined 95% UCL the TRV-based HQs were all less than 1 (Table 5-15).

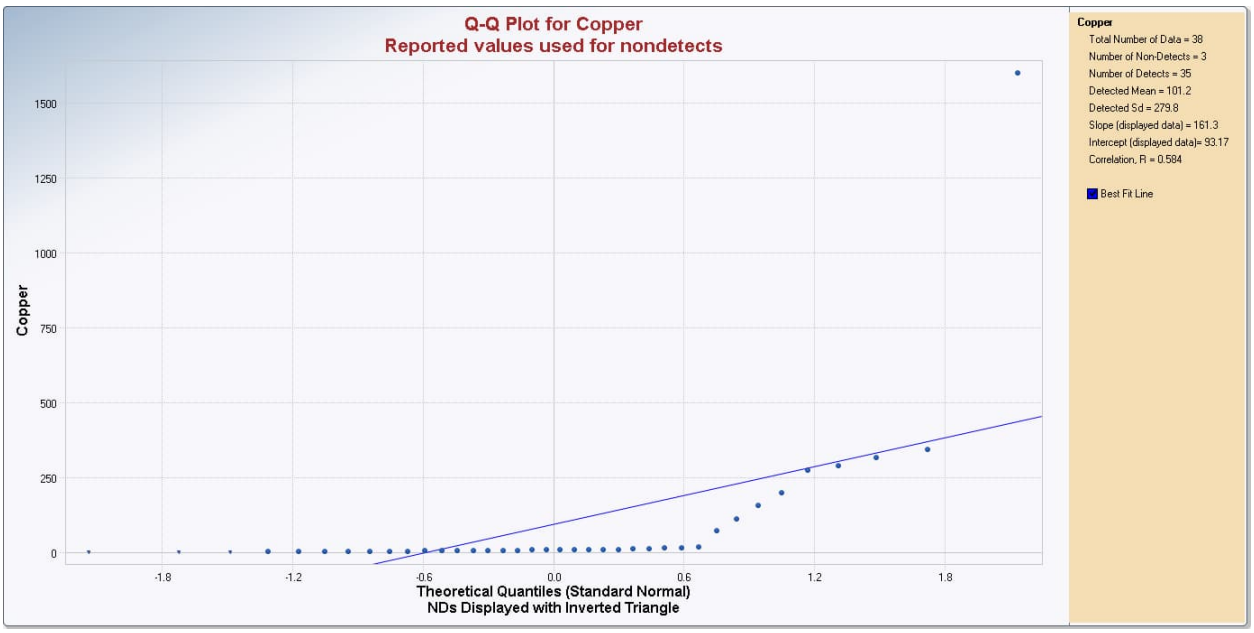

Figure 5-1. Q-Q Plot for Copper

5.6 Uncertainty Assessment

Uncertainties are inherent in all risk assessments. The nature and magnitude of the uncertainties depend on the amount and quality of data available, degree of knowledge concerning site conditions, and assumptions made to perform the assessment. As such, there are uncertainties with each line of evidence used in the ERA. The following subsections summarize uncertainties by each line of evidence.

Although several of the evaluated site ecological receptors had HQs in excess of unity (1.0), it is important to note that such HQs do not provide indication that receptors are at risk (USEPA 1989; Tannenbaum 2005a). HQs above 1.0 also do not guarantee that there is even one individual of a modeled species at the site that displays the toxicological endpoint evaluated. Since HQs above 1.0 do not demonstrate a problem at a site for modeled site receptors, the HQs cannot trigger the development of remediation goals or considerations of cleaning up a site. This uncertainty section reviews HQ method limitations in ERA beyond the HQ not being a risk expression.

It is also important to note that computationally, the HQ expresses the ratio of a receptor's estimated intake of a given chemical to an assumed safe dose of that chemical, and that commonly, estimated HQs are of untenable magnitude. A computed HQ of 20, by way of example, suggests that the receptor is consuming a chemical with toxic properties, each day, at a rate of 20 multiples of the safe dose. Realistically, no site receptor could survive such an ongoing (chemical) dietary exposure. Where sites of interest, such as all four watersheds at IAAAP, are not observed to be devoid of animal life, it is clear that the HQ estimation was inaccurate.

An overarching HQ method limitation in ERA is the often-realized phenomenon of computed HQs assuming values that are described in the literature as "unrealistically high and toxicologically impossible" (Tannenbaum et al. 2003; Tannenbaum 2005b). Assuming that modeled receptors were appropriate for assessment (e.g., valid populations, as opposed to individuals that are assumed to be present on the site), NOAEL-based HQs as low as 20 are unreasonable and untenable. An HQ of 20 conveys that the receptor is understood to be consuming on a daily basis, a chemical with toxic

properties, at a rate of 20 times the safe dose. With this being the equivalent of a dose that is 2–4 times the effect level, the modeled receptor would not be expected to be capable of surviving. Further, the site would be devoid of the modeled species and others like it, and particularly because the site is imagined having been imposing its toxic exposures on site receptors for multiple decades. Critically, HQs > 1.0 should not be taken at face value, and they should not be used to determine that site receptors are at risk. Toxicologically impossible HQs, whether of a SLERA or a BERA, are likely not a trigger for invoking remedial action intended to benefit site ecological receptors.

In addition, the use of various models (e.g., uptake and food-web exposures) carries with it some associated uncertainty as to how well the model reflects actual conditions. The uncertainties in this ERA are mainly attributable to the following factors:

- Ingestion Screening Values (TRVs). Data on the toxicity of some chemicals to the upper trophic-level receptor species were sparse or lacking, requiring the extrapolation of data from other wildlife species or from laboratory studies with nonwildlife species. This is a typical limitation for ERAs because so few wildlife species have been tested directly for most chemicals of concern. The uncertainties associated with toxicity extrapolation were minimized by selecting the most appropriate test species for which suitable toxicity data were available. The factors considered in selecting a test species to represent a receptor species included taxonomic relatedness, trophic level, foraging method, and similarity of diet.

- Direct Exposure Screening Values. Some chemicals in site-related media were detected but had no available screening value. Even though these chemicals were identified as COPECs, potential unacceptable adverse effects could not be determined for these chemicals and they are not considered drivers of adverse effects. The focus of this assessment was on detected chemicals with ecotoxicological (effects) data. These chemicals are typically the most common/important drivers of adverse effects. While there is some uncertainty with the inability to consider chemicals without screening values as part of the risk evaluation in this assessment, that uncertainty is considered low because of the attention paid to the COPECs with screening values in the same chemical groups. For chemicals with screening values, care was taken to measure concentrations using analytical methods that could measure below appropriate action (screening) levels.

- Chemical Mixtures and Cumulative Concentrations. Information on the ecotoxicological effects of chemical interactions is generally lacking, which required (as is standard for ERAs) that the chemicals be evaluated on an individual basis during the comparison to screening values. This could result in an underestimation of adverse effects (if there are additive or synergistic effects among chemicals) or an overestimation of adverse effects (if there are antagonistic effects among chemicals).

- Receptor Species Selection. Reptiles also are potential receptors in the watersheds but were not evaluated quantitatively even when exposure pathways were likely to be complete. For food-web exposures, these taxonomic groups were evaluated using other fauna (birds and mammals) as representatives because of the general lack of taxon-specific ingestion-based toxicological data. This represents an uncertainty in the ERA. It also was assumed that reptiles were not exposed to significantly higher concentrations of chemicals and were not more sensitive to chemicals than other receptor species evaluated in the ERA. In addition, there is some uncertainty associated with the use of specific receptor species to represent larger groups of organisms (such as guilds).

- Watershed-based approach. Evaluating risk on a watershed scale for ecological receptors provides a more realistic scenario and reduces the level of uncertainty in the risk assessment as upper-trophic receptors utilize the watershed as a whole and not just small sections that may have elevated EPCs.

- 95 Percent UCLs Versus Mean Media Concentrations. During the refinement step, EPCs were based on either the 95 percent UCL or mean media concentrations. This depended on the frequency of

detection. The mean was used when there were too few detections to reliably estimate the values in ProUCL.

- Detected Chemicals Lacking Screening Values. Several chemicals were detected in various media without media-specific screening values. These chemicals were primarily SVOC and VOC chemicals that have a low octanol-water partition coefficient (K_{ow}) and are not known to be highly bioaccumulative. In addition, these chemicals were not widely detected within the various media. As a result, though there is uncertainty around these chemicals, it is unlikely that at the concentration and frequency detected, these chemicals contribute to unacceptable adverse effects.
- Nondetected Chemicals. Several chemicals were analyzed for and not detected in the surface water and sediment samples. Because these chemicals were not detected, they are assumed to not be present in site media. There is some uncertainty associated with this assumption, because some reporting limits are higher than screening values. However, because standardized analytical methods were used and the sample reporting limits were not elevated relative to the method reporting limits for the vast majority of samples and analytes, this uncertainty is considered low for the purposes of conducting this ERA. Tables 5-16 through 5-23 present screening statistics for nondetect chemicals in surface water and sediment at Skunk River, Long Creek, Brush Creek, and Spring Creek.
- Food-Web Exposure Modeling. Chemical concentrations in aquatic food items (plants, benthic invertebrates, and fish) were estimated from abiotic media concentrations and were not directly measured. The use of generic, literature-derived exposure models and BAFs introduces some uncertainty into the resulting estimates. The values selected and methodology employed were intended to provide a conservative, yet reasonable estimate of potential food-web exposure concentrations, likely overestimating bioaccumulation and potential dietary exposures.
- Area Use Factors. AUFs were assumed to equal 1. This also is a conservative assumption since a significant percentage of each upper trophic-level receptor species' time could be spent foraging offsite in unimpacted areas or in areas where chemical concentrations are expected to be significantly lower.
- Mean Media Concentrations. As is typical in an ERA, a finite number of environmental media samples were used to develop the exposure estimates. The most realistic exposure estimates for mobile species with relatively large home ranges and for species populations (even those that are immobile or have limited home ranges) are those based upon the mean chemical concentrations in each medium to which these receptors are exposed. This is reflected in the wildlife dietary exposure models in the *Wildlife Exposure Factors Handbook* (USEPA 1993), which specify the use of average media concentrations. Given the mobility of the upper trophic-level receptor species used in the ERA, the use of maximum chemical concentrations (rather than mean concentrations) to estimate the exposure via food webs would likely be overly conservative.

SECTION 6

Summary and Conclusions

This Facility-wide, watershed-based ERA was conducted in accordance with USEPA guidance to support RI at IAAAP from this point forward. The ERA presented herein identified explosives and metals in the SLERA stage as COPECs for each of the four watersheds (Brush Creek, Spring Creek, Long Creek, and Skunk River). Following the WOE evaluation in the SLERA, only COPECs for Brush Creek sediment (explosives), and Spring Creek sediment (copper and silver) were carried forward into the BERA. No surface water COPECs were carried forward into the BERA. This BERA was conducted in accordance with USEPA guidance. Potential for adverse effects were estimated for the most representative ecological receptors and pathways of ecological exposure, based on available RI sampling data and a current understanding of habitats and ecosystems present at the IAAAP. The BERA included both direct exposure evaluations and food-web-based (dose-based) exposure evaluations. The BERA indicated that potential for adverse effects to ecological receptors is unlikely from site-related metals and explosives detected in sediment/surface water at the Skunk River, Long Creek, Brush Creek, and Spring Creek watersheds at IAAAP. After completion of the additional evaluations and refinement, no COPECs were identified as COECs for any of the watersheds. Therefore, no further ecological evaluation is warranted with respect to aquatic receptors in Brush Creek, Spring Creek, Long Creek, and Skunk River at IAAAP.

Although contamination is still present at many IRP sites within the four watersheds in this document, site contamination is not resulting in potential adverse effects for surface water and sediment within Skunk River and the creeks overall. As summarized in Tables 1-1 through 1-4, surface water and sediment samples were adequately collected to evaluate potential impacts to the river and the creeks. These results will be used to support ongoing RI work at IAAAP.

Table 1-1. Summary of RI Sites within the Skunk River Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to River	Approximate Distance to Skunk River	Surface Water/Sediment Samples Collected to Assess Potential Impacts to River
Line 3A Ammo LAP—Artillery (Line 3A) IAAP-004G	Line 3A is an approximately 119-acre active site located in the southwestern quadrant of the IAAAP. The site contains approximately 64 buildings, 18 of which are related to explosives processing. Line 3A, known as a "load line," was established for the loading of large shells and bombs and began operations in 1942. Production was discontinued in 1945 but resumed production in 1949 until updates were made in 1989. During this time, it functioned as an artillery LAP operation. Line 3A remains active since its updates in 1989 and current operations include mine production and confidential mission activities. NPDES discharges from Line 3A are monitored at two outfall locations: Outfall 34 (at Building 3A-70-1) and Outfall 35 (at Sump 21). Both outfalls historically carried explosives-contaminated wastewater from LAP operations that was processed through carbon filter columns and subsequently discharged to a tributary of Skunk River for Outfall 34 and to an intermittent tributary that joins Long Creek approximately 1 mile from the site for Outfall 35.	Line 3A is located within two watersheds, the Skunk Watershed and the Long Creek Watershed. The ground cover at Line 3A is composed of buildings, grassy areas, and roads. The topography at Line 3A is generally flat and on top of a ridge that divides the Long Creek watershed to the north and the Skunk River watershed to the south. The surrounding ground slopes to the north, south, and west. Surface drainage is through ditches and intermittent streams that ultimately join Skunk River or Long Creek. Line 3A falls along a potentiometric divide; therefore, overburden groundwater flows south-southwest toward the Skunk River in the southern half of the site and north-northeast toward Long Creek in the northern half of the site. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • RDX • Barium • Chromium	Historical surface runoff to intermittent streams that join Skunk River. Groundwater contamination is delineated within site boundary and will not discharge to river.	4,700 feet (2,000 feet to Long Creek)	NPDES outfall samples collected prior to offsite discharge of runoff (Figure 1-3). Surface water and sediment samples collected from Skunk River downstream of site, south of the DA/DF (Figure 4-1). No surface water or sediment samples collected from Long Creek to assess this site since the closest reach for Long Creek to this site is running through the Firing Sites Area, and therefore more likely to be impacted by that site (Figure 4-2).
Line 3A Sewage Treatment Plant/Drying Beds (Line 3A STP) IAAP-029	The Line 3A STP is located in the southwestern portion of the IAAP facility, adjacent to production Line 3A. It only encompasses approximately 0.5 acre and includes a sludge-drying bed, a trickling filter, a secondary clarifier, a chlorine contact chamber, an Imhoff tank, and a transformer. The Line 3A STP operated from 1943 to 1945 and from 1949 to the late 1980s, and it was built to treat only domestic waste from production Line 3A and blowdown water from the steam-generating plant. Line 3A STP is no longer in use. Demolition of the Line 3A STP is planned for the future. Although the Line 3A STP is no longer in use, there is still discharge from the STP as a result of groundwater infiltration into the cracks in the laterals from the STP. Surface runoff also collects around and infiltrates into the lateral lines. Effluent from the Line 3A STP area flows to the intermittent stream west of the site to Outfall 014, in accordance with the 2020 NPDES permit.	At Line 3A STP, the area surrounding the tank, buildings, and drying beds is primarily grass covered and is bounded by an agricultural field to the north, a tree-covered area to the west and south, and Line 3A to the east. An intermittent tributary to Skunk River also lies north and west of the site. Topography at the site is relatively flat with a slope to the southwest. The Line 3A STP is drained primarily by an intermittent stream approximately 500 feet away from the site. Surface drainage at the Line 3A STP is through overland flow toward the intermittent stream and eventually to Skunk River (Tetra Tech 2009). Groundwater is expected to flow southwest toward Skunk River. There are no perennial surface water habitats within the site.	OU-12	Soil and groundwater • No perennial surface water features are present onsite.	Soil • Pesticides and metals were identified above site characterization PALs in the Phase I RI report. Groundwater • It is unlikely that groundwater at the Line 3A STP has been impacted; additional RI being conducted to confirm absence of contamination.	Historical surface runoff to intermittent stream that joins Skunk River. Groundwater contamination is not present at the site and therefore would not impact the river.	5,200 feet	NPDES outfall samples collected prior to offsite discharge of runoff (Figure 1-3). Surface water and sediment samples collected from Skunk River downstream of site, south of the DA/DF (Figure 4-1).

Table 1-1. Summary of RI Sites within the Skunk River Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to River	Approximate Distance to Skunk River	Surface Water/Sediment Samples Collected to Assess Potential Impacts to River
Line 3A Pond IAAP-041 and IAAP-041G	The Line 3A Pond is an approximately 2.5-acre site in the southwestern quadrant of the IAAAP, immediately south of Plant Road I and to the south of the eastern portion of Line 3A. Although called a "pond," the site is actually a former leach field with an adjacent raw chemical disposal pit that were constructed in 1956 and closed in 1958 or 1959. The combined size of these two features is less than 0.5 acre. Approximately 15,000 gallons of spent and neutralized sulfuric and hydrochloric acid were disposed of at Line 3A Pond. It is possible that the raw chemical disposal pit was used to neutralize these acids. When the disposal pit was closed, soil samples were collected to determine the extent of potentially contaminated soil until a dark blue-gray soil was encountered; the pit was then excavated. There is no surface indication of the former leach field and raw chemical disposal pit. There is no surface indication of the former leach field and raw chemical disposal pit and the site is currently covered with natural vegetation.	Line 3A Pond is covered by grass and cedar trees. Surface drainage from the leach field/disposal pit flows towards a drainage swale, located approximately 15 feet east. The drainage swale joins a drainageway approximately 750 feet south of the site, where it forms an intermittent stream that joins the Skunk River approximately 0.8 mile southwest of the site and approximately 200 feet south of the IAAAP southern boundary. Topography at the site is relatively flat. From the former leach field and chemical disposal pit, the terrain slopes gently to the southeast towards the drainage swale. The western portion of Line 3A Pond slopes gently to the south-southwest and drains into the western intermittent tributary. There are no perennial surface water habitats within the site.	OU-7	Soil and groundwater • No perennial surface water features are present onsite.	Soil • Aluminum • Arsenic • Chromium • Cobalt • Iron • Manganese Groundwater • 2,6-Dinitrotoluene • 2-Nitrotoluene • 3-Nitrotoluene • Nitrobenzene • Hexavalent chromium • 1,2-Dichloroethane • 1,2-Dichloropropane • Bromodichloromethane • Chloroform • Methylene chloride	Historical surface runoff to intermittent stream that joins Skunk River. Groundwater contamination may extend beyond the site boundary, but its spatial distribution indicates that it is limited in extent and will not discharge into the river.	4,900 feet	Surface water and sediment samples collected from Skunk River downstream of site, south of the DA/DF (Figure 4-1).

Table 1-1. Summary of RI Sites within the Skunk River Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to River	Approximate Distance to Skunk River	Surface Water/Sediment Samples Collected to Assess Potential Impacts to River
Demolition Area and Deactivation Furnace (DA/DF) CC-06	The DA is an approximately 23-acre area in the southwest portion of the IAAAP. The DA is an active site used for emergency open burn and open detonation of rejected ammunition. The DA has been in use since the early 1940s for open detonation of ammunition and since 1997 for open burn operations. The DA was included in the facility's application for an emergency basis RCRA permit for open demolition and subsequently permitted for open burning operations and is included in the 2018 Hazardous Waste Management RCRA permit. Since 1981, this area has been used on an emergency-only basis, requiring approval by the State of Iowa to open-burn propellants in pans that have faulty stabilizers or to open-detonate ammunition rounds that become armed during the assembly process. At the DA, the open detonation area comprises an open field with six shallow detonation pits. The open burn area consists of an access road to an open field where a burn pan can be placed. In addition, earth-covered, poured-concrete waste storage bunkers are present at the site. The DF is an approximately 0.55-acre area in the southwest portion of the IAAAP. The DF, located southeast of the DA, is an inactive site. Former Building 900-199-2, which housed the DF was closed under the RCRA permit in 1995. The DF was used to destroy small explosives-loaded components such as detonators, primers, and fuses.	The topography at the DA is relatively flat with steeply incised intermittent tributaries to the southeast, south, and west. The DA facilities and the access road are located on the upper elevations. The DF was constructed on a topographic high. Intermittent tributaries are present downgradient and cut between the DA and the DF site. Surface drainage is to the west and south into intermittent tributaries incised into loess and glacial till. The intermittent streams run to Skunk River, approximately one-half mile to the southwest. Groundwater flow is directed towards topographic lows to the south and west and generally follows topography. There are no perennial surface water habitats within the site.	OU-7 (RCRA)	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 4-nitrotoluene • RDX • Aluminum • Arsenic • Cobalt • Iron • Manganese • Vanadium	Historical surface runoff to intermittent tributaries that join Skunk River. Groundwater contamination is delineated within site boundary and will not discharge to river.	2,500 feet	Seep samples collected from drainages incised in bedrock downgradient of the DA/DF did not exceed PALs in the RI. Surface water and sediment samples collected from Skunk River downstream of site, south of the DA/DF (Figure 4-1).

[a] RI is ongoing or was recently completed for OU-4, OU-6, OU-7, OU-9, OU-10, and OU-12. The following OUs have a ROD in place are no longer under RI: OU-1, OU-3, OU-5, and OU-8. The RI report for OU-4 (Leidos and Jacobs 2022), the RI Addendum for OU-9 (Leidos 2020), the RI report for OU-11 (CH2M 2021a), and the Phase 1 RI Report for OU-12 (CH2M 2021b) have been finalized. The RI reports for OU-6, OU-7, and OU-10 are under the internal draft phase. The Phase 2 RI report for OU-12 will be completed in the future. The OU under which each IRP will be addressed after the RI may change.

[b] The COPCs listed for sites included in the internal draft RI reports for OU-6, OU-7, and OU-10, and in the final Phase I RI report for OU-12 and may change.

DA = Demolition Area

DF = Deactivation Furnace

DNT = dinitrotoluene

LAP = load, assemble, and pack

NPDES = National Pollutant Discharge Elimination System

PAL = project action limit

RCRA = Resource Conservation and Recovery Act

RDX = Royal Demolition Explosive (cyclotrimethylenetrinitramine)

RI = remedial investigation

ROD = Record of Decision

STP = Sewage Treatment Plant

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 1 Ammo LAP (missile/former Atomic Energy Commission) (Line 1) CC-IAAP-001G	Line 1 encompasses 231 acres, is located in the northeastern quadrant of the IAAAP, and is immediately east of Brush Creek. It historically contained more than 200 buildings and associated facilities; several of the buildings have been recently demolished or are scheduled for demolition as part of IAAAP's facility demolition plan. Line 1 is contiguous with the Line 1 Impoundment. Ammunition was produced at Line 1 from 1941 until August 1945. During this period, the wastewater resulting from the daily steam cleaning of buildings flowed outside the doorways directly into drainage ditches (TN & Associates 2001) and via aboveground concrete gutters/troughs to nearby ditches that ultimately transported the wastewater into Brush Creek. Production resumed in 1948 under the control of the Atomic Energy Commission to fabricate explosive components for nuclear weapons; the Atomic Energy Commission operated Line 1 until 1975, when operation returned to Army-controlled production of ordnance. Under the Army, 155-mm rounds (later moved to Line 3), grenades, and a variety of warheads were produced. Discharge of process wastewater to the NPDES outfalls stopped after July 1977. Current production of ordnance occurs in the southwest portion of Line 1. Other buildings are either used for storage or are not used. Although not considered wastewater, nonprocess water, which was dewatered from former subterranean Building 1-40, was previously discharged through a short section of the contaminated water collection system piping into a ditch southwest of the building. Building 1-40 was recently demolished. Nonprocess water from sumps in the subterranean portions of Buildings 1-63-1 through 1-63-6 is treated via carbon filtration then discharged to the IAAAP sanitary sewer.	Line 1 consists of buildings, roads, railroad tracks, and drainage ditches, which are surrounded by grass-covered areas. The topography at Line 1 is relatively flat, sloping slightly to the west-southwest. Surface water at Line 1 occurs in unlined drainages but is ephemeral. Brush Creek lies immediately west of Line 1 and receives surface drainage from Line 1. The direction of overburden groundwater flow in the area is generally towards Brush Creek. However, the potentiometric surface at Line 1 is influenced by several features including pumping and discharge of water from subterranean buildings and the ephemeral ditches. The Brush Creek riparian corridor through this area is primarily developed or landscaped and is of low habitat quality.	OU-6	Groundwater • Soil and sediment is addressed under OU-1 ROD and FUSRAP ROD. • No perennial surface water features are present onsite.	Groundwater • 1,3,5-TNB • 2,4-DNT • 2,6-DNT • 2-Amino-4,6-DNT • 2-Nitrotoluene • 4-Amino-2,6-DNT • HMX • RDX • TNT • Iron, dissolved • Manganese • Manganese, dissolved • Ttrichloroethene	Historical surface runoff to ephemeral ditches and Brush Creek. Groundwater contamination is delineated within site boundary and will not discharge to river.	0 feet (The eastern side of Line 1 is adjacent to Brush Creek.)	Surface water and sediment samples collected from several locations along Brush Creek adjacent to, upstream, and downstream of the Line 2 site boundary (Figure 4-4).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 2 Ammo LAP (Artillery/Shape) (Line 2) IAAP-002G	Line 2 encompasses a 140-acre active site in the north-central portion of the IAAAP. The site consists of 31 buildings and covered walkways and includes equipment rooms, explosives magazines, and nine sump buildings. Line 2 is used to load, assemble, and pack 120-millimeter ammunition and blank ammunition. Line 2 has been in operation as an LAP line since IAAAP was constructed in 1941, except for a temporary shutdown period from 1947 to 1949. Prior to the implementation of the NPDES outfalls, untreated wastewater containing dissolved explosives was directly discharged to sumps and surface drainage ditches located adjacent to Buildings 2-05-1 and 2-05-2. In the early 1970s, two wastewater treatment buildings were constructed, and NPDES Outfalls 21 and 22 were established. Outfalls 21 and 22 were included in the latest (2020) NPDES permit; however, NPDES discharges have not occurred since 2004 at Outfall 21 or since 2000 at Outfall 22. The outfalls are permitted to discharge effluent with explosives. Currently, none of the Line 2 buildings (including the melt buildings) discharges explosives-contaminated wastewater.	Line 2 consists of buildings, covered walkways, roads, and railroad tracks that are surrounded by grass-covered areas. The topography at Line 2 is relatively flat with a slope to the southwest at the northern part of the site and a slight slope to the west at the majority of the site. Immediately west of the site boundary, the surface elevation drops toward Brush Creek. Intermittent surface water drainage occurs through a number of drainage ditches and culverts that ultimately discharge to Brush Creek. Surface water runoff is routed through ditches and culverts to Brush Creek and to an intermittent tributary that joins Brush Creek. Groundwater flow at Line 2 is toward Brush Creek ranging from southwest to northwest. At Brush Creek, groundwater is likely not discharging to surface water, or the discharge is infrequent. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • HMX • Nitrobenzene • RDX • Antimony • Arsenic • Barium • Chromium	Historical surface runoff to ditches and intermittent tributaries that join Brush Creek. There is a shallow RDX groundwater plume located outside of the Line 2 site boundary along Brush Creek; however, this does not appear to be a source of contamination to the creek based on analytical data.	<100 feet	Surface water and sediment samples collected from several locations along Brush Creek adjacent to, upstream, and downstream of the Line 2 site boundary (Figure 4-4). Surface water and sediment samples have been collected upstream and downstream of the small groundwater plume along the creek. NPDES outfall samples collected prior to offsite discharge of runoff (Figure 1-3).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 3 Ammo LAP (Artillery) (Line 3) IAAP-003G	Line 3 encompasses a 149-acre inactive site in the central portion of IAAAP, located between Lines 9, 6, and 7 and Brush Creek. Line 3 historically consisted of 56 buildings and covered walkways comprising equipment rooms, explosives magazines, sump buildings, melt buildings, and two process water treatment facilities. More than 30 buildings have been demolished as part of IAAAP's facility demolition plan. Line 3 began operating as a production line when the IAAAP was constructed, in 1941, and underwent a temporary shutdown from 1945 to 1949. Line 3 was largely inactive, except for mine production until 1978 and demilling activities in 1979, with production of new munitions commencing in 1979 and continuing until 1992, when operations ceased. Between 1977 and 1985, metal-cleaning operations were conducted at Line 3. Line 3 was in standby status for several years but currently is used for mine-clearing line charge and Stinger missile operations. NPDES discharges from Line 3 are monitored at one outfall location (Outfall 32). Historically process water from Line 3 was discharged from Outfall 32 and another outfall that is no longer used.	Line 3 is primarily grass-covered, with a few buildings and a few roads that lead to demolished building footprints. The topography of Line 3 slopes to the south and southeast. Surface drainage discharges into one of three intermittent tributaries of Brush Creek. The groundwater flow direction at Line 3 varies from the east to the southeast toward Brush Creek There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2,4-DNT • 2,6-DNT • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • HMX • RDX • Antimony • Arsenic • Barium • Chromium • Manganese	Historical surface runoff to intermittent tributaries that join Brush Creek. Groundwater contamination is delineated within site boundary and will not discharge to river.	1,000 feet	Surface water and sediment samples collected from several locations along Brush Creek the east and southeast (downstream) of the Line 3 site boundary (Figure 4-4). NPDES outfall samples collected prior to offsite discharge of runoff (Figure 1-3).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Lines 4A and 4B Ammo Assembly (Lines 4A/4B) IAAP-005G	Lines 4A/4B is a 57.8 acre site that encompasses two production lines (Lines 4A and 4B) in the north-central portion of the IAAAP facility. Line 4A was constructed in 1941 and used to manufacture fuzes for ammunition production. Between 1946 and 1954, the site was used to disassemble, detonate, and convert fuzes. Line 4A was reconstructed between 1979 and 1983 and reopened in 1984 to serve as a detonator assembly facility. The 1984 NPDES permit describes carbon filters that could treat explosives-contaminated wastewater at Building 4A-58-2. These carbon filter columns were used minimally and discharged wastewater to the sanitary sewer system. Line 4A was renovated in 1996 for a private industry. Line 4A is currently inactive.	Lines 4A/4B falls within the Brush Creek and the Long Creek watersheds. Both lines include multiple buildings and are surrounded by grass-covered areas and roadways connecting the buildings. The topography at Lines 4A and 4B is relatively flat with a gentle slope toward the east and the southwest at Line 4A. Line 4A is drained by ditches or intermittent tributaries of Brush Creek. Surface drainage at Line 4B is through overland flow and a southward-trending ditch that eventually flows to the headwaters of a Long Creek tributary. There is a hydraulic divide at Lines 4A/4B, with Line 4A in the Brush Creek watershed and Line 4B in the Long Creek watershed. At Line 4A, overburden groundwater east of the hydraulic divide flows east-southeast toward Brush Creek. At Line 4B, overburden groundwater west of the hydraulic divide flows to the west-southwest toward Long Creek. The only perennial surface water feature withing the site is a retention pond surrounded by landscaped field, providing low quality habitat.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified.	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is not present at the site and therefore, would not impact the creeks.	3,200 feet (5,700 feet to Long Creek)	Surface water and sediment samples were collected from Brush Creek adjacent to Line 1 and the Line 1 Impoundment that could also be used to assess potential impacts from this site (Figure 4-4). No surface water and sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.
Lines 5A and 5B Ammo Assembly (Lines 5A/5B) IAAP-006G	Lines 5A/5B is located in the north-central portion of the IAAAP. Line 5A encompasses approximately 33 acres in the Brush Creek watershed and historically contained 17 buildings. Line 5B encompasses approximately 41 acres in the Long Creek watershed, west of Line 5A, and historically contained 18 buildings. All buildings at both Lines 5A and 5B have been demolished as part of IAAAP's facility demolition plan. Line 5A was operated as a booster production line from 1942 until the end of World War II in 1945 and resumed in 1949 during the Korean War for pelletizing 2,4,6-TNT, miscellaneous demolition blocks, and grenades, and assembling explosive components. Process wastewater was discharged from Building 5A-140-3 through an NPDES-permitted outfall to a ditch that flows south to an intermittent tributary of Brush Creek at the southern boundary of the site. This outfall is no longer used. The site is currently inactive, production ceased between 1988 and 1991, and the site is no longer permitted for NPDES discharge.	Lines 5A/5B falls within the Brush Creek and the Long Creek watersheds. The site mostly consists of roads and open grass-covered areas. Topography at Lines 5A and 5B is generally flat, with a gentle slope toward the southeast. Surface drainage flows into ditches near site boundaries. At Line 5A, ditches north, east, and south of the site ultimately discharge into east- or south-flowing intermittent tributaries of Brush Creek. The southern ditch/tributary discharges into a constructed pond approximately 3,300 feet southeast of Line 5A. Ditches on the northern side of Line 5B ultimately discharge into a west-flowing intermittent tributary of Long Creek. Ditches on the southern side of the site direct runoff through Line 4B. A groundwater divide is likely present between Line 5A and Line 5B. Shallow overburden groundwater flow is to the southeast at Line 5A, and to the southwest at Line 5B. Groundwater flow in the bedrock is generally to the south. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • RDX • Antimony • Cadmium • Chromium • Manganese	Historical surface runoff to ditches and intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is defined within the site boundary and will not discharge to the creek.	2,100 feet (5,200 feet to Long Creek)	Surface water and sediment samples collected from the headwaters of Brush Creek to the east of the site (Figure 4-4). No surface water and sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 6 Ammo Production (Detonator) (Line 6) IAAP-007G	Line 6 is in the north-central portion of the IAAAP facility. It encompasses approximately 95.2 acres that historically included 34 buildings and 97 structures, most of which have been demolished or are scheduled for demolition. Line 6 is bounded by Line 9 to the south and agricultural lands and vegetated drainage ditches to the north, south, east, and west. Line 6 was used for production, storage and shipping of detonators, delays, and relays between 1941 and 1992. Prior to 1960, mercury fulminate was used for site operations at Buildings 6-91, 6-89, and 6-90. Following this period, Line 6 produced primers, detonators, and rocket igniters until the late 1960s, when the focus of production shifted to a combination of detonators, grenade fuses, and mines. During the 1980s, a range of munitions was produced and a black powder–destroying facility was installed to desensitize black powder. An NPDES permit once existed for these desensitized wastes from the Line 6 area. Two explosions occurred at Line 6, in 1968 and 1970, resulting in the dispersion of MEC. Line 6 remains in extended storage.	Topography at Line 6 is relatively flat, sloping in a general south-southeasterly direction. Surface drainage is provided by a series of ditches that flow southward into an intermittent tributary of Brush Creek. Groundwater in the overburden and bedrock flows generally south. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • MEC and MC are addressed under OU-5 ROD. • No perennial surface water features are present onsite.	Groundwater • Manganese was the only COC identified; additional RI will be conducted to verify that this metal is not site-related.	Historical surface runoff to ditches that join Spring Creek. Potential groundwater contamination is defined within site boundary and will not discharge to the creek.	2,700 feet	No surface water and sediment samples from Brush Creek to assess this site since other IAAAP sites are closer to creek and site is over 1,000 feet away (Figure 4-4).
Line 7 Ammo LAP (Line 7) IAAP-008 and IAAP-008G	Line 7 is a 25-acre site located in the central portion of the IAAAP and was built in 1942 as a production line. Currently the site sits within the boundary of an active 40-mm test range constructed in 2013. The test range is currently being used by the Army to test military munitions. During the early 1940s, Line 7 produced blank ammunition used in ceremonies. During World War II and the Korean War, Line 7 was used as a fuse and blank LAP facility, where artillery primers, rocket igniters, and time fuses were assembled. After 1965 and during the Vietnam War, time fuses for mortars were produced at the site. During production operations, wastes from building wash downs were discharged to gravel-lined sumps, and then allowed to leach into the ground. Line 7 was inactive after approximately 1970. All of the Line 7 buildings, including the concrete slabs, were removed in 2005-2006.	Line 7 is well-vegetated, predominately by grass. The topography at Line 7 generally slopes toward the southeast. Surface drainage at the site is through ditches and an intermittent tributary of Brush Creek that is approximately 9 feet deep from the top of the bank. Shallow groundwater flow at Line 7 ranges from southeast to southwest. There are no perennial surface water habitats within the site.	OU-7	Soil and groundwater • No perennial surface water features are present onsite.	Soil • Aluminum • Arsenic • Chromium • Cobalt • Copper • DDD • Dieldrin • Iron • Manganese • Mercury • PCBs • Phenanthrene • Thallium • Vanadium • Zinc Groundwater • No COPCs identified	Historical surface runoff to ditches and intermittent tributary that joins Brush Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	4,400 feet	No surface water and sediment samples from Brush Creek to assess this site since other IAAAP sites are closer to creek, and site is over 1,000 feet away (Figure 4-4).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 9 Ammo LAP (Mine) (Line 9) IAAP-010G	Line 9 is located in the central portion of the IAAAP facility. The site was previously identified as the "percussion line" over an area of approximately 9 acres; however, the site boundary encompasses over 80 acres. Historically, Line 9 included 38 buildings; however, former production buildings at Line 9 were removed in 2010 as part of the Army's Facilities Reduction Program. The site currently falls within the boundary of the active 40-millimeter test range. It is enclosed by a security fence that also encompasses Line 6 and Line 7. Line 9 was operated as a percussion component production, storage, and loading facility from 1942 through 1953 and also loaded primer M54. Between 1953 and the 1960s, Line 9 was put on layaway status. From the 1960s to the early 1970s, Line 9 was used for the production of mines and mine fuses. This process included the use of Freon 113, which was stored on a concrete pad. During the 1980s, Line 9 operations included the Ground-emplaced Mine Scattering System and Gator projects, and Line 9 was used largely as an assembly line. Line 9 was closed sometime after 1991.	Line 9 is primarily grass-covered with a few remaining roads that lead to the cleared/paved areas associated with demolished building footprints. The topography at Line 9 is relatively flat, with a slight slope toward the south and southeast. Surface drainage is via culverts and several manmade drainage ditches, which are typically shallow (2 to 4 feet deep) on the northern half of the site and increase in depth (up to 10 feet deep) on the southern half of the site. Intermittent surface water from the ditches converges in a ditch south of the site, which flows south into a pond. Overflow from the pond flows into an intermittent tributary through Line 7 and joins another intermittent tributary of Brush Creek. Shallow groundwater flow direction is variable at Line 9 and has ranged from the southeast to the southwest. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • Total 2,3,7,8-TCDD TEQ • Pentachlorophenol • Freon 113 • 1,1-Dichloroethene • Acetone • Methylene chloride	Historical surface runoff to ditches to intermittent tributary of Brush Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	3,900 feet	No surface water and sediment samples from Brush Creek to assess this site since other IAAAP sites are closer to creek and site is over 1,000 feet away (Figure 4-4).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Old Fly Ash Waste Pile (OFAWP) IAAP-015 and IAAP-015G	The OFAWP encompasses 6.3 acres within the Brush Creek watershed in the southeastern quadrant of the IAAAP. There are no structures or remains of structures at the site. Between 1940 and 1976, fly ash from the coal-fired Main Heating Plant and the Building 1-62 Heating Plant was deposited on the ground surface at the OFAWP. The extent and volume of the fly ash pile has varied over time due to deposits over its operational time period and from removal for other uses at IAAAP. The vertical extent (thickness) of the fly ash was evaluated in 2004 by visual inspection and confirmed by hollow-stem auger drilling. The results of the evaluation indicated that the thickness of the fly ash ranges from 9 to 12 feet on the west half of the pile to 20 to 25 feet on the east half of the pile where the ground surface slopes toward Brush Creek at that time.	The site is well-vegetated, is dominated by grasses and a few small trees and shrubs, and is bounded by Brush Creek to the east, Road H to the west, and drainages to the north and south. The terrain at the top of the OFAWP is relatively flat. Near the eastern boundary of the site, the ground surface becomes steep as it slopes down approximately 30 to 40 vertical feet to Brush Creek. Surface runoff from the top of the OFAWP flows generally in sheets to the north and west, into a ditch that runs parallel to Road H and connected tributaries. Due to the thickness of the grasses in the area, this sheet flow may be impeded except during heavy rainfall events. On the steep slopes of the OFAWP, runoff may flow directly into Brush Creek (particularly where the grasses are thin to nonexistent) and its related tributaries to the north and south. Shallow overburden groundwater flow at the OFAWP is east towards Brush Creek. The portion of Brush Creek bordering the site is sinuous and rocky, with approximately 50% tree cover, providing good quality habitat.	OU-7	Soil, ash, groundwater, surface water, and sediment	Soil and ash • Aluminum • Arsenic • Chromium • Cobalt • Iron • Manganese • Mercury • Silver Groundwater • Arsenic • Barium • Beryllium • Boron • Cadmium • Chromium • Lead Surface water • No COPCs identified Sediment • No COPCs identified	Historical and current surface runoff to Brush Creek. Potential groundwater contamination is defined within site boundary and will not discharge to the creek.	0 feet (Creek flows through site.)	Surface water and sediment samples collected from several locations along Brush Creek within sire boundary (Figure 4-5).

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 1 Former Wastewater Impoundment (Line 1 Impoundment) IAAP-016 and IAAP-016G	The Line 1 Impoundment is located southwest of Line 1 and includes a former wastewater impoundment pond that is approximately 1,300 feet long and that parallels Brush Creek. There are no buildings or permanent structures within the site boundary. The former wastewater impoundment pond was constructed in 1948 and used to impound explosives-contaminated water from Line 1 prior to its discharge into Brush Creek. The Line 1 Impoundment was used to allow particulates from explosives-contaminated wastewater to settle prior to the wastewater being discharged downstream. In 1997, active discharge to Brush Creek from Line 1 operations ceased, Brush Creek was rerouted around the Line 1 Impoundment, and an interim remedial action was implemented. Surface water in the pond is occasionally discharged to Brush Creek, in accordance with its operation and maintenance plan. The water is treated prior to discharge, if necessary, to ensure RDX concentrations are below 2 µg/L. A pre-engineered metal building is located near the lower hydraulic control structure and houses a granular activated carbon water treatment system.	The Line 1 Impoundment currently consists of a treatment wetland and pond that is surrounded and covered by grass and other vegetation. Brush Creek lies to the west of the impoundment pond, within the Line 1 Impoundment site boundary. The ground topography slopes towards Brush Creek and towards the center of the pond. Surface water is usually present within the impoundment pond. A diversion dam and hydraulic control structures are in place to maintain the water level in the impoundment pond and creek. Controlled discharges from the pond to Brush Creek are also used to control water levels. During period of dry weather conditions, standing water in the pond may be minimal. The portion of Brush Creek running through the site is heavily modified and channelized, providing moderate quality habitat. The Impoundment Pond is mostly exposed and surrounded by constructed wetlands, providing moderate quality habitat.	OU-6	Groundwater, surface water, and sediment	Groundwater • Manganese, dissolved • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • HMX • RDX • TNT Surface water and sediment • Explosives and metals are being addressed via an interim remedial action.	Historical surface runoff to Brush Creek. Although current discharges from the impoundment pond to the creek occur, water is treated prior to discharge. Groundwater contamination is present as a small plume adjacent to Brush Creek. Vertical gradients indicate that groundwater is not discharging to surface water at this location.	0 feet (Creek flows through site.)	Surface water and sediment samples collected from several locations along Brush Creek within site boundary and from the impoundment pond (Figure 4-4). Surface water and sediment samples collected adjacent and downstream of small groundwater plume.
Pesticide Pit IAAP-017 and IAAP-017G	The Pesticide Pit is an inactive 0.5-acre site located in the central portion of the IAAAP, south of Line 3 and west of the Old Winnebago School House. The pit was an 8 foot square by 3 feet deep plywood structure that was lined with a geomembrane and limestone. The Pesticide Pit was used between 1968 and 1974 to dispose of rinsate from empty pesticide and herbicide containers and sprayers. During the late 1970s and early 1980s, disposal activities at the pit ceased and the pit was capped.	The Pesticide Pit is heavily vegetated with scattered trees and an open grassy area on the east side of the old Winnebago School house. The topography of the Pesticide Pit is generally flat, sloping east to northeast. Overland surface water flows into a shallow (less than 3 feet deep) ditch that runs along the east-west road located north of the former pesticide pit and then ultimately discharges into Brush Creek. Shallow groundwater flow varies from north-northeast to the southeast. There are no perennial surface water habitats within the site.	OU-7	Soil and groundwater • No perennial surface water features are present onsite.	Soil • Total 2,3,7,8-TCDD (TEC) • DDD • DDT • Aluminum • Antimony • Arsenic • Chromium (hexavalent) • Cobalt • Copper • Iron • Lead • Manganese • Phenanthrene • Thallium • Vanadium • Delta-BHC Groundwater • Hexavalent chromium	Historical surface runoff to ditches that may eventually flow to Brush Creek. Groundwater contamination is delineated within site boundary and will not discharge to river.	3,000 feet	No surface water or sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Abandoned Coal Storage Yard (ACSY) IAAP-042 and IAAP-042G	The ACSY includes the location of a former coal pile and bounded on the north and east by railroad tracks and on the southeast by Line 1. This area is approximately 15 acres in size. From 1950 through 1968, coal was the primary fuel used for the Steam Generating Plant at Line 1. Stockpiled coal was left in place when the plant switched to No. 2 fuel oil in 1968. The coal pile was not capped or lined. Runoff flowed over or around the coal pile to Brush Creek. The coal pile was removed in October 1993 and placed on the IAAAP Main Heating Plant coal pile. Following removal and sampling, the former coal pile area was covered with topsoil and seeded with native grass.	The location of the former coal pile is moderately vegetated with tall grasses and trees. The land at the ACSY is generally flat with a gentle southerly slope. The tributary south of the former coal pile acts as a storm water conveyance for runoff water from other areas north of the site and joins the upstream tributary of Brush Creek. Groundwater flow in the area of the ACSY is assumed to the east and south toward Brush Creek and its upstream tributaries. There are no perennial surface water habitats within the site.	OU-7	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • Arsenic • Chromium • Benzo(a)pyrene • Acenaphthylene • Benzo(g,h,i)perylene • Phenenthrene • Sulfate Groundwater • There is no basis for a contaminant release to groundwater.	Historical surface runoff to intermittent tributary that joins Brush Creek. Groundwater contamination is not present at the site and therefore, would not impact the creeks.	<100 feet	Surface water and sediment samples collected from headwaters to Brush Creek, just outside northeast corner of site boundary. Samples also collected from Brush Creek to west and southwest (downstream) of site boundary (Figure 4-4).
Line 800 and Pinkwater Lagoon IAAP-044 and IAAP-044G	Line 800 and Pinkwater Lagoon encompasses approximately 18 acres in the central part of the IAAAP. The site includes over 20 former buildings and structures that are encompassed by a security fence. Pinkwater Lagoon is an approximately 9-acre area adjacent to and southeast of Line 800. Line 800 was constructed in 1941. From 1943 to 1955, the primary functions of the line were renovating medium- to major-caliber shells and bombs for reprocessing, and reconditioning and repainting shells and bomb casings. In 1968, an inert preassembly and inspections operation began in former Building 800-04. In 1973 a pinkwater treatment plant was completed to treat a paint-stripping/metal-cleaning facility. In 1980, the assembly of blank ammunition was the principal activity at Line 800. From 1983 to 1989, remote sawing of explosives items, remote core drilling, and remote disassembly of projectiles supported other IAAAP production lines. Line 800 is no longer in use. Pinkwater Lagoon was originally constructed in 1943 as a leaching field for wastewater. It received explosives wastewater and sludges from adjacent Line 800 production facilities and various locations at the IAAAP from 1943 to the 1970s. The lagoon was used until 1970 as a settling pond to reduce particulates before process water was discharged to surface drainage to Brush Creek, and in the early 1970s, a carbon filter system was installed to treat process water.	Line 800 and Pinkwater Lagoon falls within the Brush Creek and the Long Creek watersheds. The Line 800 area consists of buildings, roads, railroad tracks, and drainage ditches, which are surrounded by grass-covered areas. The Line 800 Pinkwater Lagoon currently consists of a treatment wetland and two lagoon ponds that are surrounded by a grassy berm and other vegetation. The topography at Line 800 and Pinkwater Lagoon is generally flat with gentle slopes to the southeast and southwest. Surface drainage on the Brush Creek watershed portion of Line 800 flows through drainage ditches and culverts and eventually converges at the headwaters of a tributary to Brush Creek. Surface drainage near Pinkwater Lagoon is generally toward a tributary north of Pinkwater Lagoon, though some surface drainage may also flow to the southeast. Controlled discharges from the lagoon to the Brush Creek tributary north of the lagoon are also used to control water levels. There is a groundwater divide beneath the site. Groundwater flows to the southwest in the western portion of the site and to the northeast, east, and southeast in the eastern portion of the site. The Pinkwater Lagoon is mostly exposed and surrounded by constructed wetlands, providing moderate quality habitat.	OU-6	Groundwater (Line 800 and Pinkwater Lagoon) Soil, sediment, and surface water (Pinkwater Lagoon Only) Soil outside Pinkwater Lagoon is addressed under OU-1 ROD.	Groundwater • 1,3,5-TNB • 1,3-Dinitrobenzene • 2,4-DNT • 2,6-DNT • 2-Amino-4,6-DNT • 2-Nitrotoluene • 3-Nitrotoluene • 4-Amino-2,6-DNT • HMX • Nitrobenzene • RDX • TNT • Antimony • Arsenic • Barium • Cadmium • Chromium • Cobalt • Iron • Manganese • Freon 113 • 1,2-dichloroethane Soil, sediment, and surface water • Explosives and metals are being addressed via an interim remedial action.	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is defined close to the site boundary and will not discharge to the creek.	450 feet (3,600 feet to Long Creek.)	Surface water and sediment samples were collected from Brush Creek to the northeast (downstream) and east of the site (Figure 4-5). No surface water and sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek and since other IAAAP sites are closer to creek.

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Central Test Area (CTA) IAAP-047G	The CTA is an approximately 6.4-acre, largely inactive site in the north-central portion of the IAAAP facility. The CTA comprises the former Central Testing Laboratory (CTL), housed in Building 600-84, and two former test areas, one in the walled-in area south of Building 600-84 and one approximately 815 feet northeast of Building 600-84 (firing pit). The firing pit and surrounding fencing is in the former test-fire area. The historical records review reported that Building 600-84 and the walled-in area south of the building jointly known as the CTL were constructed in 1941 and operated until 1963. Operations at the CTL consisted of testing components such as fuzes, primers, and detonators inside the building and testing the inside charge of grenades in the walled-in area. The field north and east of Building 600-84, known as the test-fire area, was constructed between 1941 and 1950 and operated for an unknown period of time. The test-fire area was used to test-fire hand grenades, adaptor boosters, and aerial mines. Building 600-84 is currently occupied/leased by Advanced Environmental Technology, which is contracted by the U.S. Army to dispose of military and commercial explosive wastes, ammunition, propellants, fuses, components, explosives, and other reactive waste items at IAAAP.	The CTA falls within the Brush Creek and the Long Creek watersheds. The ground surface is primarily grass-covered. The topography at the CTA is generally flat with a slope to the east and southeast on the far eastern portion of the site. Surface runoff in the eastern half of the site moves toward an intermittent tributary of Brush Creek, whereas surface runoff at Building 600-84 moves to the southwest toward a tributary to Long Creek. Surface drainage from the site is likely to be sheet flow toward the intermittent features Groundwater at the CTA flows to the southeast. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • MEC and MC are addressed under OU-5 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified.	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	3,300 feet (6,600 feet to Long Creek.)	No surface water and sediment samples were collected from Brush Creek to assess this site since other IAAAP sites are closer to creek and site is over 1,000 feet away (Figure 4-4). No surface water and sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.

Table 1-2. Summary of RI Sites within the Brush Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Yard L	Yard L is an approximately 12-acre site located approximately 1,000 feet south of the northern boundary of the IAAAP. Yard L encompasses three long, rectangular buildings oriented east–west with railroad tracks in the northern portion of the IAAAP facility. Each of the three warehouses in this area is approximately 500 feet long by 50 feet wide. Concrete loading docks approximately 510 feet long by 10 feet wide are located adjacent to the south side of each warehouse. Between 1960 and approximately 1975, a portion of Yard L (Warehouses L-37-1, L-37-2, and L-37-3) was used by the Atomic Energy Commission to provide Line 1 storage space for classified component parts. The three warehouse buildings were used to facilitate receipt and shipment of finished products used in the nuclear weapons production at Line 1. Radioactive materials handled on Line 1 were received in a sealed configuration and were swipe tested before use. Yard L is currently in use by the U.S. Army for storage of inert parts and materials.	The ground surface at Yard L consists of relatively flat terrain with little changes in topography. Overland surface water flow in the southeastern part of Yard L drains southward into northern tributaries at the headwaters of Brush Creek. Shallow groundwater flow in the eastern part of Yard L is to the southeast (toward Brush Creek). Groundwater flow in the upper bedrock aquifer is generally toward the west or southwest at Yard L. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil was evaluated under FUSRAP. • No perennial surface water features are present onsite.	The final RI for OU-11 concluded that there is no basis for a contaminant release to groundwater.	Historical surface runoff to tributary at the headwaters of Brush Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	2,100 feet	Surface water and sediment samples collected from the headwaters to Brush Creek, southeast of the site (Figure 4-4).
Construction Debris Site #1 CC-IAAP-001	Construction Debris Site #1 covers approximately 1.34 acres and was used to discard construction and demolition debris. Debris is visible in several eroded areas along the steep embankment adjacent to Road H. Surface debris also exists along the drainage located at the base of the embankment along Road H. Visible debris includes scattered bricks, corrugated metal, metal parts, wire, and metal banding.	The site is primarily grass-covered or wooded. It is bounded by roads. Surface runoff could occur along the drainage. Groundwater flows from northeast to southwest. There are no perennial surface water habitats within the site.	OU-9	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • No site-related COCs identified. Groundwater • No site-related COCs identified.	Historical surface runoff to tributary at the headwaters of Brush Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	100 feet	Surface water and sediment samples collected from Brush Creek east (downstream) of the site (Figure 4-5).
Construction Debris Site #2 CC-IAAP-002	Construction Debris Site #2 covers approximately 0.625 acres and is located along an intermittent tributary to Brush Creek in a forested area south of Line 2. The site was used to discard construction and demolition materials, including sheets of metal, bricks, corrugated transite roofing/siding, wire, buckets, and wood. The debris appears to have been placed along the banks of a drainage feature which discharges to Brush Creek. The end of the debris lies approximately 100 to 200 feet from the confluence with Brush Creek.	The site is heavily wooded. Surface runoff could occur along the drainage and towards Brush Creek. Groundwater flows from northeast to southwest. There are no perennial surface water habitats within the site.	OU-9	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • No site-related COCs identified. Groundwater • No site-related COCs identified.	Historical surface runoff to tributary at the headwaters of Brush Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	1,300 feet	Surface water and sediment samples collected from Brush Creek west and south (downstream) of the site (Figure 4-5).

			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Brush Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek

[a] RI is ongoing or was recently completed for OU-4, OU-6, OU-7, OU-9, OU-10, and OU-12. The following OUs have a ROD in place are no longer under RI: OU-1, OU-3, OU-5, and OU-8. The RI report for OU-4 (Leidos and Jacobs 2022), the RI Addendum for OU-9 (Leidos 2020), the RI report for OU-11 (CH2M 2021a), and the Phase 1 RI Report for OU-12 (CH2M 2021b) have been finalized. The RI reports for OU-6, OU-7, and OU-10 are under the internal draft phase. The Phase 2 RI report for OU-12 will be completed in the future. The OU under which each IRP will be addressed after the RI may change.

[b] The COPCs listed for sites included in the internal draft RI reports for OU-6, OU-7, and OU-10, and in the final Phase I RI report for OU-12 and may change.

COC = chemical of concern

COPC = chemical of potential concern

CTA = Central Test Area

CTL = Central Testing Laboratory

DDD = dichlorodiphenyldichloroethane

DNT = dinitrotoluene

FUSRAP = Formerly Utilized Sites Remedial Action Program

HMX = cyclotetramethylene-tetranitramine

LAP = load, assemble, and pack

MC = munitions constituents

MEC = munitions and explosives of concern

NPDES = National Pollutant Discharge Elimination System

OFAWP = Old Fly Ash Waste Pile

PCB = polychlorinated biphenyl

RI = remedial investigation

RDX = Royal Demolition Explosive (hexahydro-1,3,5-trinitro-1,3,5-triazine)

ROD = Record of Decision

TCDD = tetrachlorinated dibenzo-p-dioxin

TEQ = toxic equivalent

TNB = 1,3,5-trinitrobenzene

TNT = trinitrotoluene

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 3A Ammo LAP—Artillery (Line 3A) IAAP-004G	Line 3A is an approximately 119-acre active site located in the southwestern quadrant of the IAAAP. The site contains approximately 64 buildings, 18 of which are related to explosives processing. Line 3A, known as a "load line," was established for the loading of large shells and bombs and began operations in 1942. Production was discontinued in 1945 but resumed production in 1949 until updates were made in 1989. During this time, it functioned as an artillery LAP operation. Line 3A remains active since its updates in 1989 and current operations include mine production and confidential mission activities. NPDES discharges from Line 3A are monitored at two outfall locations: Outfall 34 (at Building 3A-70-1) and Outfall 35 (at Sump 21). Both outfalls historically carried explosives-contaminated wastewater from LAP operations that was processed through carbon filter columns and subsequently discharged to a tributary of Skunk River for Outfall 34 and to an intermittent tributary that joins Long Creek approximately 1 mile from the site for Outfall 35.	Line 3A is located within two watersheds, the Skunk Watershed and the Long Creek Watershed. The ground cover at Line 3A is composed of buildings, grassy areas, and roads. The topography at Line 3A is generally flat and on top of a ridge that divides the Long Creek watershed to the north and the Skunk River watershed to the south. The surrounding ground slopes to the north, south, and west. Surface drainage is through ditches and intermittent streams that ultimately join Skunk River or Long Creek. Line 3A falls along a potentiometric divide; therefore, overburden groundwater flows south-southwest toward the Skunk River in the southern half of the site and north-northeast toward Long Creek in the northern half of the site. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • RDX • Barium • Chromium	Historical surface runoff to intermittent streams that join Skunk River. Groundwater contamination is delineated within site boundary and will not discharge to river.	2,000 feet (4,700 feet to Skunk River.)	NPDES outfall samples collected prior to offsite discharge of runoff (Figure 1-3). Surface water and sediment samples collected from Skunk River downstream of site, south of the DA/DF (Figure 4-1). No surface water and sediment samples collected from Long Creek to assess this site since the closest reach for Long Creek to this site is running through the Firing Sites Area, and therefore more likely to be impacted by that site (Figure 4-2).
Lines 4A and 4B Ammo Assembly (Lines 4A/4B) IAAP-005G	Lines 4A/4B is a 57.8 acre site that encompasses two production lines in the north-central portion of the IAAAP facility. Line 4A was constructed in 1941 and used to manufacture fuzes for ammunition production. Between 1946 and 1954, the site was used to disassemble, detonate, and convert fuzes. Line 4A was reconstructed between 1979 and 1983 and reopened in 1984 to serve as a detonator assembly facility. The 1984 NPDES permit describes carbon filters that could treat explosives-contaminated wastewater at Building 4A-58-2. These carbon filter columns were used minimally and discharged wastewater to the sanitary sewer system. Line 4A was renovated in 1996 for a private industry. Line 4A is currently inactive.	Lines 4A/4B falls within the Brush Creek and the Long Creek watersheds. Both lines include multiple buildings and are surrounded by grass-covered areas and roadways connecting the buildings. The topography at Lines 4A and 4B is relatively flat with a gentle slope toward the east and the southwest at Line 4A. Line 4A is drained by ditches or intermittent tributaries of Brush Creek. Surface drainage at Line 4B is through overland flow and a southward-trending ditch that eventually flows to the headwaters of a Long Creek tributary. There is a hydraulic divide at Lines 4A/4B, with Line 4A in the Brush Creek watershed and Line 4B in the Long Creek watershed. At Line 4A, overburden groundwater east of the hydraulic divide flows east-southeast toward Brush Creek. At Line 4B, overburden groundwater west of the hydraulic divide flows to the west-southwest toward Long Creek. The only perennial surface water feature withing the site is a retention pond surrounded by landscaped field, providing low quality habitat.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is not present at the site and therefore, would not impact the creeks.	5,700 feet (3,200 feet to Brush Creek.)	Surface water and sediment samples were collected from Brush Creek adjacent to Line 1 and the Line 1 Impoundment that could also be used to assess potential impacts from this site (Figure 4-4). No surface water or sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Lines 5A and 5B Ammo Assembly (Lines 5A/5B) IAAP-006G	Lines 5A/5B is located in the north-central portion of the IAAAP. Line 5A encompasses approximately 33 acres in the Brush Creek watershed and historically contained 17 buildings. Line 5B encompasses approximately 41 acres in the Long Creek watershed, west of Line 5A, and historically contained 18 buildings. All buildings at both Lines 5A and 5B have been demolished as part of IAAAP's facility demolition plan. Line 5A was operated as a booster production line from 1942 until the end of World War II in 1945 and resumed in 1949 during the Korean War for pelletizing 2,4,6-TNT, miscellaneous demolition blocks, and grenades, and assembling explosive components. Process wastewater was discharged from Building 5A-140-3 through an NPDES-permitted outfall to a ditch that flows south to an intermittent tributary of Brush Creek at the southern boundary of the site. This outfall is no longer used. The site is currently inactive, production ceased between 1988 and 1991, and the site is no longer permitted for NPDES discharge.	Lines 5A/5B falls within the Brush Creek and the Long Creek watersheds. The site mostly consists of roads and open grass-covered areas. Topography at Lines 5A and 5B is generally flat, with a gentle slope toward the southeast. Surface drainage flows into ditches near site boundaries. At Line 5A, ditches north, east, and south of the site ultimately discharge into east- or south-flowing intermittent tributaries of Brush Creek. The southern ditch/tributary discharges into a constructed pond approximately 3,300 feet southeast of Line 5A. Ditches on the northern side of Line 5B ultimately discharge into a west-flowing intermittent tributary of Long Creek. Ditches on the southern side of the site direct runoff through Line 4B. A groundwater divide is likely present between Line 5A and Line 5B. Shallow overburden groundwater flow is to the southeast at Line 5A, and to the southwest at Line 5B. Groundwater flow in the bedrock is generally to the south. There are no perennial surface water habitats within the site.	OU-6	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • RDX • Antimony • Cadmium • Chromium • Manganese	Historical surface runoff to ditches and intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	5,200 feet (2,100 feet to Brush Creek.)	Surface water and sediment samples collected from the headwaters of Brush Creek to the east of the site (Figure 4-4). No surface water or sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.
Line 8 Ammo Load, Assemble, and Pack (LAP) (Fuse/Rocket) Groundwater (Line 8) IAAP-009G	Line 8 is in the central portion of the IAAAP facility and on the western edge of the 40-millimeter fragmentation zone. The site encompasses an approximately 22 acre area and is bisected by a service road that runs north–south. An intermittent tributary to Long Creek also runs north–south, parallel to the road. Line 8 was used for producing Amatol (an explosive composed of TNT and ammonium nitrate) during World War II, and for fertilizer manufacturing and fuze and rocket igniter LAP operations following the war. Operations ceased at Line 8 around 1950. When the site was operational, it contained a gate house, compressor house, service house, and a tank farm composed of 13 aboveground tanks that was used to store ammonium nitrate liquor. After operations ceased in 1950, the tank farm was removed, and the two buildings were burned.	The site is predominantly tree-covered. The topography at Line 8 slopes downward from both the eastern and western boundaries of the site, converging in a topographic low represented by an intermittent tributary of Long Creek that parallels the service road. All surface water runoff in the area flows into this tributary, eventually emptying into Mathes Lake approximately 2,000 feet south of the Line 8 boundary. Facility-wide groundwater levels suggest that the overall flow direction in this area is to the southeast. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	The final RI for OU-11 concluded that there is no basis for a contaminant release to groundwater.	Historical surface runoff to intermittent tributary that joins Long Creek.	2,200 feet	Surface water and sediment samples collected from Long Creek west of the site and from Mathes Lake, which is downstream of the site (Figure 4-3).

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Possible Demolition Site South Yard G Groundwater (PDS) IAAP-018G	The PDS is an inactive site near the southern IAAAP property boundary. South Yard G is an approximate 15-acre area to the south of Plant Road K and is associated with demolition activities. Plant Road K runs east–west through the northern part of the site, and an overhead electric utility right-of-way runs along the northern boundary of the site. Fencing is in place around the perimeter of the PDS. South Yard G was used as a demolition area for ammunition items and for demilitarizing white phosphorus rounds during the 1940s and possibly into the early 1950s. There are no structures or remains of structures currently present. Archaeological sites are present, typically as homesteads.	South Yard G is predominantly wooded and undeveloped. The PDS is generally flat with a gentle slope toward Long Creek and steeper slope in the far northeastern portion. A west-southwest-flowing intermittent drainage cuts through the center of South Yard G. A southwest-flowing intermittent stream is present on the southeastern flank of the site. Given the lack of slope toward these two drainages, sheet flow southwest toward Long Creek would be the primary surface drainage at PDS. Perennial, south-flowing Long Creek is immediately west of South Yard G. The groundwater flow direction is west-southwest toward Long Creek. Groundwater likely discharges in this area to Long Creek through seeps at the glacial till and bedrock outcrops. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified	Historical surface runoff to Long Creek and intermittent tributaries that join Long Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	<100 feet	Surface water and sediment samples collected from Long Creek immediately west of the site and from Long Creek upstream and downstream of the site (Figure 4-3).

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Inert Disposal Area (IDA) IAAP-020G	The IDA encompasses approximately 55 acres in the western portion of the IAAAP and includes ILF Trenches 1–5, CEA, Trench 6, Trench 7 (i.e., Corrective Action Management Unit) and the associated sedimentation ponds. Wastes were also disposed and managed in other areas of the IDA (i.e., Former Blue Sludge Lagoon, Former Holding Pond/Sludge Drying Bed, Former Burning Ground, and Former Metal Storage Yard) located immediately southeast of the ILF. The IDA is surrounded by vacant land with vegetation and trees. An office is located at the IDA and is used by maintenance workers. Starting in 1941, the ILF Trenches 1-5 and Trench 6 North received residential and industrial waste materials such as residential and cafeteria refuse, plastic, tin cans, scrap lumber, and unsalvageable paper and cardboard until the mid-1990s. From 1980 to 1983, a northern portion of Trench 5 (also known as the Ash Disposal Cell) received RCRA hazardous wastes, such as ash. From 1998 to 2007, the Trench 6 Landfill (Soil Repository), Trench 7, and the CEA only received contaminated soils from OU-1 remediation activities under CERCLA. The Former Blue Sludge Lagoon was a surface impoundment that received chromium hydroxide sludge. In 1984, the contents of the lagoon and underlying soil were excavated. The Former Metal Storage Yard was used to store scrap lumber, metal, used railroad ties, paper, cardboard, etc. for eventual sale to the public. Closure activities at the ILF Trenches 1-5, CEA, Trench 6, Trench 7, and the RCRA Ash Disposal Cell occurred from 1989 to 2011. In 2011 and 2012, the use of the CEA, Trench 6, and Trench 7 sedimentation ponds were discontinued and the ponds were removed and revegetated.	The topography of the IDA has been significantly altered by the construction of the landfill and subsequent capping. The IDA is generally highest in the northwest area of the ILF and slopes in all directions. Prior to the capping of the ILF Trenches 1-5 in 1998, surface drainage for the bulk of the ILF and the Former Burning Ground was directed into an intermittent stream on the south side of the ILF that flowed southwesterly from the area between Trenches 3 and 4, before turning south immediately south of Trench 6. The only surface water currently present at the IDA is where groundwater discharges to the ephemeral ditch entering the north end of the former CEA Pond Surface water runoff from the IDA currently flows to the southwest toward an intermittent tributary of Long Creek, which is approximately 1,000 feet west of the IDA. The tributary then enters Long Creek approximately 4,000 feet south of the IDA. Shallow groundwater flow is to the southwest, while bedrock groundwater flow is generally to the south. There are no perennial surface water habitats within the site.	OU-4	Groundwater • Soil is addressed under an Action Memorandum for and an Interim Action Record of Decision. • No perennial surface water features are present onsite.	Final Groundwater COCs • 1,2-dichloroethane • 2,4-Dichlorophenol • 2,4-DNT • 2-Amino-4,6-DNT • 2-Methyl-4,6-dinitrophenol • Benzene • Manganese • Naphthalene • Nitrobenzene • PCP • Total 2,3,7,8-TCDD (TEQ) • Trichloroethene • Vinyl Chloride Final Groundwater Radionuclides of Concern • Lead-212 • Potassium-40 • Radium-226 • Radium-228	Historical surface runoff to intermittent tributary that joins Long Creek. Groundwater contamination may extend to intermittent tributaries and could potentially discharge to surface water.	250 feet	Surface water and sediment samples were collected from Long Creek to the southwest (immediately downstream of site), where intermittent tributary connects with the creek (Figure 4-2).

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Unidentified Substance (Oil) Waste Site (USWS) IAAP-022 and IAAP-022G	The USWS is an area of approximately 20 feet by 20 feet and located approximately 15 to 20 feet south of the railroad track bed, in the central portion of the IAAAP. The USWS area was not used as an operational line and no buildings are associated with the USWS. The USWS was defined after detection of an unidentified substance, believed to be road surfacing oil, was discovered on July 16, 1985. The spill was thought to have been from a leaking railroad tank car. According to site personnel, the spill area was subsequently covered with approximately 10 feet of fill sloping away from the railroad tracks.	The USWS site is unmaintained forest. Surface topography at the USWS is relatively flat. The location of the spill area is moderately to densely vegetated with small to medium trees. Surface water runoff originating in the location of the spill area during precipitation events collects in a drainage depression which parallels the track bed. The groundwater in the area flows southwest toward an unnamed tributary of Long Creek. There are no perennial surface water habitats within the site.	OU-11	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • No site-related COCs identified Groundwater • The final RI for OU-11 concluded that there is no basis for a contaminant release to groundwater.	Historical surface runoff. However, the site is approximately 450 feet north of the nearest tributary of Long Creek and the small spill is unlikely to have migrated to surface water. Groundwater contamination is not present at the site and therefore, would not impact the creek.	2,600 feet to Mathes Lake	No surface water and sediment samples were collected from Long Creek as it is unlikely surface runoff from the small spill would have reached the creek.
Construction Debris Disposal Area/ Construction Debris Landfill (CDL) IAAP-028 and IAAP-028G	The CDL is an approximately 5.7-acre inactive disposal site in the central portion of IAAAP. A railroad is located to the north and steep embankments flank the site to the south and west where intermittent tributaries are present. Road M is located to the east-southeast of the site. Although the site was used as a disposal area and storage yard for debris, it was not used as an official landfill. The CDL operated from the 1940s to approximately September 1992 for the disposal of construction debris, including concrete, masonry, dirt, and ash. Wood or other organic materials were excluded. Review of the 1941 and 1957 aerial photos showed a historical drainage within the center of the site that is now covered; this may have been used for disposal activities. Fly ash was also likely disposed of at the site based on its having been exposed during subsurface trenching. The CDL stopped receiving debris between 1989 and September 1992. In 1996, the debris was leveled, and clean fill material was brought in to allow a cover of vegetation to be established. The earthen cover ranges in thickness from 1 to 3 feet. There is no liner beneath the debris.	The CDL is a grassy area with woodlands at the edges. It is located on the edge of an upland plateau. The terrain on the plateau is generally flat, with a slight rise in the western portion that slopes gently to the edges of the plateau. The terrain drops off sharply at the edges of the plateau into two steeply cut intermittent tributaries to the west and south. Surface drainage is south and west toward the two intermittent tributaries that converge near the south-southwestern portion of the site and ultimately flow into Long Creek. Shallow groundwater flow at the CDL varies between west and southwest. Groundwater–surface water interactions are unlikely because the two drainage ditches flanking the CDL are dry except during heavy rainfall events (or snowmelt). No groundwater seeps have been observed in this area. There are no perennial surface water habitats within the site.	OU-7	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • Aluminum • Aroclor-1254 • Arsenic • Benzo(a)anthracene • Benzo(a)pyrene • Benzo(a,h)anthracene • Chromium • Cobalt • Iron • Manganese • Mercury • PCBs • Thallium • Vanadium Groundwater • Bis(2-ethylhexyl)phthalate • Chloroform • Trichloroethene	Historical surface runoff to intermittent tributaries that join Long Creek. Groundwater contamination is delineated by surface water and sediment samples from intermittent tributaries within site boundary and will not discharge to creek.	2,000 feet to Mathes Lake	Surface water and sediment samples were collected from Long Creek and Mathes Lake, at locations downstream of the site (Figure 4-3).

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Firing Sites Area (FSA) IAAP-030 and IAAP-30G	The FSA is a 437-acre site that is fenced and located in the western portion of the IAAAP approximately 1 mile from the nearest IAAAP boundary. The FSA is grouped by building proximity into five subareas; FS-1 and FS-2 Area, FS- 3, 4, and 5 Area, the FS-6 Area which includes FS-6, FS-7, FS-8 and FS-15, and the FS-12 Area which includes FS-9, FS-10, FS-11, and FS-12, and the FS-14 Area. The FSA was developed by the Army Environmental Command to support test firing of munitions for the IAAAP and was used by the Army Environmental Command between 1948 and 1974. During this time, munitions containing depleted uranium were tested at the site. The FSA is currently an operational testing range being used by the U.S. Army to test military munitions. However, munitions containing depleted uranium are no longer tested at the FSA.	The FSA consists of cleared areas where grasses, shrubs, and isolated small trees are present, along with a densely forested area surrounding the perimeter of the individual firing site areas. Two branches of Long Creek flow through the FSA; surface water in these branches drain into Mathes Lake approximately 1,000 feet from the southeast perimeter of the FSA. Surface water in intermittent drainages flow east toward the creek. Rock bluffs of varied heights flank Long Creek on both the southerly and northerly sides at different segments of the creek. The direction of shallow groundwater flow at the FSA is generally convergent toward the western and northern branches of Long Creek. Groundwater in the deep aquifer generally flows to the south or southeast beneath the FSA, in the general direction of Mathes Lake, Long Creek, and the Skunk River. The branches of Long Creek pass through the densely forested area and provide high-quality habitat.	OU-7	Groundwater and Surface Water • Soil and sediment are addressed under the FUSRAP ROD.	Groundwater • Antimony • Arsenic • Barium • Chromium • Cobalt • Iron • Lead • Manganese • Mercury • Nickel • Uranium • Actinium-228 • Bismuth-214 • Cesium-137 • Lead-210 • Lead-212 • Lead-214 • Potassium-40 • Radium-226 • Thorium-234 • Uranium-234 • Uranium-235 • Uranium-238 Surface Water • Mercury • Uranium-238	Historical surface runoff to Long Creek branches.	0 feet (Two branches of Long Creek flow through the FSA.)	Surface water and sediment samples collected within the site boundary, from both branches of Long Creek and from where the branches converge at Long Creek (Figure 4-2).

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Building 600-86 Septic System IAAP-038 and IAAP-038G	The Building 600-86 Septic System is located in the north-central portion of the IAAAP. Building 600-86 was a 2,400 square foot building built in 1941 and constructed with its own septic tank and drain. The septic tank discharged into a ditch along the railroad tracks approximately 750 feet west of the building. Building 600-86 served in several roles from its construction in 1941 until approximately 1986. Building 600-86 was in operation from 1941 to 1953 as the Central Chemical analytical laboratory for the purpose of performing drinking water and wastewater analyses, as well as analysis of primer mixes containing lead azide. The waste from the primer tests was deactivated with ceric ammonium nitrate and the resultant waste solution was disposed in the Explosive Disposal Area (EDA). Starting in 1953, Rooms A, B, and C in Building 600-86 were used to store a variety of solvents, corrosive wastes, spent nonhalogenated solvents, and explosives-contaminated laboratory chemicals and solvents. In 1983, the floor drains that drained to the building's septic system were plugged, the sludge was removed from the septic tank, and the tank was filled with sand and remains in place. The building was demolished in 2007.	The septic tank is located within part of an agricultural tract that may be used for row crops. The location of the former building is moderately vegetated with grasses and small trees and densely vegetated near the railroad tracks. The topography is generally flat, with a slight slope to the southwest. No surface water or wet sediment are found in the Building 600-86 Septic System. Overland surface drainage in the vicinity of the former Building 600-86 likely flows north and east into ditches along the road and railroad or flows to the south toward a drainage feature. Shallow groundwater flow in this area ranges from the west to the southwest. There are no perennial surface water habitats within the site.	OU-7	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • Aluminum • Arsenic • Chromium • Hexavalent chromium • Cobalt • Iron • Manganese • Mercury • Phenanthrene • Vanadium Groundwater • Aluminum • Antimony • Arsenic • Barium • Chromium • Iron • Lead • Manganese • Mercury • Vanadium	Historical surface runoff to ditches that may connect with intermittent tributary to Long Creek. Surface water-groundwater interaction is not likely based on the depth to groundwater (occasionally 3.5 feet bgs) and the depth of the ditches (less than 3 feet deep).	4,100 feet	No surface water and sediment samples collected from Long Creek to assess this site due to the distance of the site to the creek.
Fly Ash Disposal Area (FADA) IAAP-043 and IAAP-043G	The FADA is an inactive site located on approximately 6 acres in the west-central area of the IAAAP, directly west of the existing Fly Ash Landfill. The FADA was used for disposal of fly ash, residual coal, clinkers, and other residue from the coal-fired power plant during the 1940s and 1950s. The site is abandoned and covered with natural vegetation, but has no soil cover or clay cover.	The FADA is covered by natural vegetation. The western portion is diversely vegetated with densely populated large trees along the intermittent tributary and the eastern portion with tall grasses and scattered trees. The natural ground surface at the FADA slopes toward the west-southwest. Surface runoff at the site drains to the intermittent tributary and then to Long Creek. Groundwater flows to the south-southeast towards Mathes Lake. There are no perennial surface water habitats within the site.	OU-7	Soil, Ash, and Groundwater • No perennial surface water features are present onsite.	Soil • Arsenic • Chromium • Sulfate Groundwater • Arsenic	Historical surface runoff to intermittent tributary that joins Long Creek.	1,500 feet	No surface water and sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek and the limited contamination observed at the site.

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Line 800 and Pinkwater Lagoon IAAP-044 and IAAP-044G	Line 800 and Pinkwater Lagoon encompasses approximately 18 acres in the central part of the IAAAP. The site includes over 20 former buildings and structures that are encompassed by a security fence. Pinkwater Lagoon is an approximately 9-acre area adjacent to and southeast of Line 800. Line 800 was constructed in 1941. From 1943 to 1955, the primary functions of the line were renovating medium- to major-caliber shells and bombs for reprocessing, and reconditioning and repainting shells and bomb casings. In 1968, an inert preassembly and inspections operation began in former Building 800-04. In 1973 a pinkwater treatment plant was completed to treat a paint-stripping/metal-cleaning facility. In 1980, the assembly of blank ammunition was the principal activity at Line 800. From 1983 to 1989, remote sawing of explosives items, remote core drilling, and remote disassembly of projectiles supported other IAAAP production lines. Line 800 is no longer in use. Pinkwater Lagoon was originally constructed in 1943 as a leaching field for wastewater. It received explosives wastewater and sludges from adjacent Line 800 production facilities and various locations at the IAAAP from 1943 to the 1970s. The lagoon was used until 1970 as a settling pond to reduce particulates before process water was discharged to surface drainage to Brush Creek, and in the early 1970s, a carbon filter system was installed to treat process water.	Line 800 and Pinkwater Lagoon falls within the Brush Creek and the Long Creek watersheds. The Line 800 area consists of buildings, roads, railroad tracks, and drainage ditches, which are surrounded by grass-covered areas. The Line 800 Pinkwater Lagoon currently consists of a treatment wetland and two lagoon ponds that are surrounded by a grassy berm and other vegetation. The topography at Line 800 and Pinkwater Lagoon is generally flat with gentle slopes to the southeast and southwest. Surface drainage on the Brush Creek watershed portion of Line 800 flows through drainage ditches and culverts and eventually converges at the headwaters of a tributary to Brush Creek. Surface drainage near Pinkwater Lagoon is generally toward a tributary north of Pinkwater Lagoon, though some surface drainage may also flow to the southeast. Controlled discharges from the lagoon to the Brush Creek tributary north of the lagoon are also used to control water levels. There is a groundwater divide beneath the site. Groundwater flows to the southwest in the western portion of the site and to the northeast, east, and southeast in the eastern portion of the site. The Pinkwater Lagoon is mostly exposed and surrounded by constructed wetlands, providing moderate quality habitat.	OU-6	Groundwater (Line 800 and Pinkwater Lagoon) Soil, sediment, and surface water (Pinkwater Lagoon Only) Soil outside Pinkwater Lagoon is addressed under OU-1 ROD	Groundwater • 1,3,5-TNB • 1,3-Dinitrobenzene • 2,4-DNT • 2,6-DNT • 2-Amino-4,6-DNT • 2-Nitrotoluene • 3-Nitrotoluene • 4-Amino-2,6-DNT • HMX • Nitrobenzene • RDX • TNT • Antimony • Arsenic • Barium • Cadmium • Chromium • Cobalt • Iron • Manganese • Freon 113 • 1,2-dichloroethane Soil, sediment, and surface water • Explosives and metals are being addressed via an interim remedial action.	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is defined close to the site boundary and will not discharge to the creek.	3,600 feet (450 feet to Brush Creek.)	Surface water and sediment samples were collected from Brush Creek to the northeast (downstream) and east of the site (Figure 4-5). No surface water or sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek and since other IAAAP sites are closer to creek.

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Central Test Area (CTA) IAAP-047G	The CTA is an approximately 6.4-acre, largely inactive site in the north-central portion of the IAAAP facility. The CTA comprises the former Central Testing Laboratory (CTL), housed in Building 600-84, and two former test areas, one in the walled-in area south of Building 600-84 and one approximately 815 feet northeast of Building 600-84 (firing pit). The firing pit and surrounding fencing is in the former test-fire area. The historical records review reported that Building 600-84 and the walled-in area south of the building jointly known as the CTL were constructed in 1941 and operated until 1963. Operations at the CTL consisted of testing components such as fuzes, primers, and detonators inside the building and testing the inside charge of grenades in the walled-in area. The field north and east of Building 600-84, known as the test-fire area, was constructed between 1941 and 1950 and operated for an unknown period of time. The test-fire area was used to test-fire hand grenades, adaptor boosters, and aerial mines. Building 600-84 is currently occupied/leased by Advanced Environmental Technology, which is contracted by the U.S. Army to dispose of military and commercial explosive wastes, ammunition, propellants, fuses, components, explosives, and other reactive waste items at IAAAP.	The CTA falls within the Brush Creek and the Long Creek watersheds. The ground surface is primarily grass-covered. The topography at the CTA is generally flat with a slope to the east and southeast on the far eastern portion of the site. Surface runoff in the eastern half of the site moves toward an intermittent tributary of Brush Creek, whereas surface runoff at Building 600-84 moves to the southwest toward a tributary to Long Creek. Surface drainage from the site is likely to be sheet flow toward the intermittent features Groundwater at the CTA flows to the southeast. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • MEC and MC are addressed under OU-5 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified.	Historical surface runoff to intermittent tributaries that join Brush Creek or Long Creek. Groundwater contamination is not present at the site and therefore would not impact the creek.	6,600 feet (3,300 feet to Brush Creek.)	No surface water or sediment samples were collected from Brush Creek to assess this site since other IAAAP sites are closer to creek and site is over 1,000 feet away (Figure 4-4). No surface water or sediment samples were collected from Long Creek to assess this site due to the distance of the site to the creek.

Table 1-3. Summary of RI Sites within the Long Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed under RI	COPCs Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Long Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Yard C	Yard C encompasses approximately 301 acres in the eastern portion of the IAAAP and is located east of Line 2. The yard is primarily an open field containing 43 storage igloos and several other support buildings. The yard is surrounded by a security fence. The igloos and their associated loading docks can be accessed from an adjacent rail line or access road. Yard C was constructed in 1941 and 1942 to serve as a storage yard. In 1947, Yard C came under control of the Army Environmental Command which utilized it for the storage of raw explosive materials and sealed radiological components that were placed into warheads. The Army Environmental Command discontinued use of Yard C in 1975. Yard C is currently being used for hay production under the IAAAP leasing program.	Yard C is located within two watersheds, the Brush Creek Watershed and the Spring Creek Watershed. Surface water runoff from the eastern part of Yard C ultimately drains into the Spring Creek Watershed. Brush Creek drains the far western portion of Yard C. The rail lines located adjacent to each row of bunkers are ditched for water drainage. Some runoff discharges to a small pond located near the eastern fence line of Yard C. Groundwater flow in the shallow aquifer is toward the southeast. Groundwater flow in the upper bedrock aquifer is generally toward the south. The only perennial surface water features withing the site are two retention ponds surrounded by landscaped field, providing low quality habitat.	OU-7	Groundwater and Surface Water • Soil and sediment are addressed under the FUSRAP ROD.	Groundwater • Barium Surface water • No COPCs identified	Historical surface runoff to drainage ditches that flow toward Spring Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	1,800 feet to Spring Creek 1,800 feet to Brush Creek	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek. Surface water and sediment samples collected from Brush Creek to southwest (downstream) of the site (Figure 4-5). Surface water samples collected from small pond within site boundary; since this surface water feature does not interact with the creek, it is evaluated with the site under the OU-7 RI.
Yard G	Yard G is a storage yard encompassing approximately 259 acres located in the southern portion of the IAAAP. Yard G contains storage igloos along the main access road, which runs in a horseshoe-like shape along the Long Creek valley wall. Each igloo, loading dock, and associated driveway is situated on small and relatively flat areas adjacent to the access road. Yard G was constructed in 1942 to serve as a storage area for the finished castings of classified shapes. In 1947, Yard G came under the control of the Army Environmental Command. The Army Environmental Command used the secured, fenced facility from 1948 until 1954 to store classified finished products. Yard G was returned to Army control in 1975 and is currently not in use.	Yard G is located in a heavily forested valley of Long Creek. The land rises rapidly behind each igloo and drops steeply from the edge of the access road toward Long Creek. A drainage ditch is present on the uphill side of the site access road that runs in front of the igloos. The natural ground surface slopes toward the creek. Surface runoff from Yard G flows into Long Creek, which flows through the center of the Yard. Shallow overburden groundwater flow is generally from the perimeter of Yard G inward toward Long Creek. Bedrock groundwater flow has a flow pattern roughly similar to shallow groundwater, with a northwest-southeast oriented groundwater flow situated near or slightly southwest of Long Creek. There are no perennial surface water habitats within the site.	OU-7	Groundwater and Surface Water • Soil and sediment are addressed under the FUSRAP ROD.	Groundwater • There is no basis for a contaminant release to groundwater. Surface water • No COPCs identified.	Historical surface runoff to Long Creek. Groundwater contamination is not present at the site and therefore, would not impact the creek.	0 feet (Long Creek flows through the site.)	Surface water and sediment samples collected from Long Creek within the site boundary (Figure 4-3).

[a] RI is ongoing or was recently completed for OU-4, OU-6, OU-7, OU-9, OU-10, and OU-12. The following OUs have a ROD in place are no longer under RI: OU-1, OU-3, OU-5, and OU-8. The RI report for OU-4 (Leidos and Jacobs 2022), the RI Addendum for OU-9 (Leidos 2020), the RI report for OU-11 (CH2M 2021a), and the Phase 1 RI Report for OU-12 (CH2M 2021b) have been finalized. The RI reports for OU-6, OU-7, and OU-10 are under the internal draft phase. The Phase 2 RI report for OU-12 will be completed in the future. The OU under which each IRP will be addressed after the RI may change.

[b] The COPCs listed for sites included in the internal draft RI reports for OU-6, OU-7, and OU-10, and in the final Phase I RI report for OU-12 and may change.

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
East Burn Pads (EBPs) IAAP-012G	The EBPs is an inactive area that encompasses 12 acres and is located in the northeast portion of the IAAAP facility. The EBPs area was used for demilitarization by open burning. The EBPs previously contained eight raised earthen burning pads (Pads 1E through 8E) that were surrounded by earthen berms to restrict horizontal movement of projectiles, with one side open for access. The site is fenced and there are no remaining structures onsite. The EBPs are immediately east of Spring Creek. The EBPs were active between 1949 and 1982 for operations that included open burning of explosives contaminated metals, propellants, explosives, and pyrotechnics-contaminated materials. Operations ceased at the EBPs in 1982 once the Explosives Waste Incinerator was constructed, and there are no remaining structures in this area.	The topography over most of the EBPs site consists of an elevated, relatively flat area that slopes to the southwest towards Spring Creek. In the northeast portion of the EBPs, the topography slopes to the east toward an intermittent tributary. West of the EBPs, the landscape is dissected by Spring Creek, and the topography changes to a steeply sloping terrain. Surface runoff from the majority of the EBPs is channeled into shallow, intermittent drainage ditches and flows west toward Spring Creek and south into a south-flowing ephemeral tributary of Spring Creek. Surface runoff from the northeastern portion of the site flows east and into the southeast-trending segment of an intermittent tributary of Spring Creek. Shallow groundwater generally flows southwest toward Spring Creek. In the northeastern portion of the site, groundwater flows more to the east, where the topography changes to slope eastward. The portion of Spring Creek in the site provides high quality habitat, however the habitat is only a small area.	OU-10	Groundwater • Soil is addressed under OU-1 ROD. • Surface water and sediment are evaluated under the West Burn Pads Area.	Groundwater • 4-Amino-2,6-DNT • RDX • Arsenic • Barium • Chromium • Cobalt • Manganese • TCE	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination does not extend to Spring Creek. Therefore, even though there is the potential for groundwater discharge to surface water along Spring Creek, groundwater contamination should not impact creek.	0 feet A very small reach of Spring Creek flows inside the western boundary of the EBPs.	Surface water and sediment samples collected from the portion of Spring Creek that touches the EBPs and from Spring Creek downstream of site (Figure 4-7).
Incendiary Disposal Area East Yard D – Groundwater (InDA) IAAP-013G	The InDA encompasses East Yard D, an inactive area that originally occupied approximately 3.6 acres before the area was expanded to include approximately 34 acres in the southeastern portion of IAAAP. The area is located inside of the Maneuver Area but is not part of the Maneuver Area. The InDA was reportedly used by a contractor from 1940 to 1946 as a high-explosives demolition area and/or for burial of unknown materials. There are no records indicating the types of munitions detonated at the InDA or definitive mention of its period of use. Historical drawings indicated that the East Yard D portion of the InDA was small (approximately 40 feet by 60 feet), encompassing three depressions reported to be burial pits for incendiary materials. However, through various investigations, the extent of MEC items was found to be larger. As a result, the InDA MRS boundary was expanded to its current extent.	The InDA is a densely wooded area adjacent to an intermittent tributary of Spring Creek (west of the former disposal area) and is bound by Plant K Road to the east. Only the remains of physical structures are present onsite, such as an old fence situated in the central portion of the site. The topography of the InDA slopes moderately to the west toward the adjacent tributary, although some areas in the central and western portions have steeper slopes. Surface drainage occurs generally as sheet flow or in channels to the adjacent tributary, which ultimately flows to Spring Creek approximately 900 feet downstream of the site. Groundwater is anticipated to generally follow the topography and flow to the west/southwest. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • MEC and MC are addressed under OU-5 ROD. • No perennial surface water features are present onsite.	Groundwater • No site-related COCs identified	Historical surface runoff to tributary that flows toward Spring Creek. Groundwater contamination is not present at the site and therefore, would not impact the creek.	700 feet	Surface water and sediment samples collected from Spring Creek to the west and south (downstream) of site (Figure 4-8).

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Boxcar Unloading Area (BCU) IAAP-014 and IAAP-014G	The BCU encompasses 7 acres and consists of two areas adjacent to the railroad tracks west of Plant Road O in Yard B, approximately 750 feet west of the Explosive Disposal Area. This area was used as an unloading and temporary storage area for dunnage lumbar in the 1940s, although the rail cars at times also transported boxes of explosives. The railroad within the site is still in use, however, in recent years, primarily trucks have transported explosives at the facility. The BCU is no longer used as a temporary storage area for dunnage lumber.	The 1991 Preliminary Assessment indicated that the area of the BCU was approximately 500 to 600 feet on the western railroad track and 400 to 500 feet on the eastern track. The area boundary has not been consistent in historical documents. The BCU is unmaintained with native grass prairie with scattered forest. Topography at the site is flat, with little relief. Surface water runoff in the area flows into ditches east of the site and into an intermittent tributary of Spring Creek approximately 100 m northeast of the site (Tetra Tech 2006). Groundwater was not encountered during RI. Shallow groundwater flow in this area has varied from the south-southwest to the east-southeast. There are no perennial surface water habitats within the site.	OU-11	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • No site-related COCs identified Groundwater • The final RI for OU-11 concluded that there is no basis for a contaminant release to groundwater.	Historical surface runoff to intermittent stream that joins Spring Creek. Groundwater contamination is not present at the site and therefore, would not impact the creek.	3,300 feet	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek.
Contaminated Waste Processor (CWP) IAAP-024	The CWP encompasses approximately 1.8 acres in the northeastern portion of the IAAAP facility. The CWP was operated from 1982 to 2004 to flash or burn materials (such as equipment, pipe, steel, empty cartridge cases, empty projectiles, and lumber) exposed to explosives or other energetic substances. Ash generated from the unit was collected in 55-gallon drums, which were retained in a RCRA accumulation area at either Building BG-199-2 or Building BG-199-3. The drums were subsequently transferred to RCRA-permitted storage facilities or disposed of offsite at the Des Moines County Landfill (JAYCOR 1996). Approximately 100 feet north of former Building BG-199-2, a 10,000-gallon fiberglass underground storage tank was used to store No. 2 diesel fuel; it was removed in 1991. A fire in 2004 damaged the CWP and rendered it inoperable. A new CWP was sited north of Building BG-199-2 within the North Burn Pads Landfill area; this new CWP is not part of IAAP-024. Building BG-199-2, which housed the former CWP, has been demolished. The IAAAP site is currently not in use.	The CWP area is primarily covered with concrete. The topography at the CWP is relatively flat with a gentle slope toward Spring Creek in the east. Surface drainage at the CWP is through overland flow toward two drainage ditches that flow eastward to Spring Creek, which is located approximately 350 feet east of the CWP (Tetra Tech 2009). Groundwater at the CWP flows southeast. There are no perennial surface water habitats within the site.	OU-12	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • Metals were identified above site characterization PALs in the Phase I RI report. Groundwater • Only 3-nitrotoluene was detected above its site characterization PAL and background threshold value in the Phase I RI report.	Historical surface runoff to drainage ditches that flow toward Spring Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	450 feet	Surface water and sediment samples collected from Spring Creek to the east (downstream) of site (Figure 4-7).

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Explosive Waste Incinerator (EWI) IAAP-025 and IAAP-025G	The EWI is an inactive, 2-acre area in the southwest corner of the Explosive Disposal Area, southwest of the Fire Training Pit. The EWI was enclosed within Building BG-199-1, which measured 28 by 110 feet. The EWI operated from November 1981 until June 1997. The EWI incinerated ammunition products that were out of date or failed to meet specifications, materials listed as hazardous wastes, wastewater treatment sludges from the manufacturing and processing of explosives, and spent carbon from the treatment of wastewater containing explosives. The EWI underwent RCRA closure in 1998 and the decontaminated incinerator was removed from the installation in 1999.	The terrain at the EWI is generally flat, with a gentle slope to the south. Drainage at the site is routed through east-flowing ditches on the north and south of the access road east of Building BG-199-1, which then join a south-flowing ditch approximately 400 feet east of Building BG-199-1. Groundwater flow directions vary from the south-southeast to the east-southeast. There are no perennial surface water habitats within the site.	OU-11	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • No site-related COCs identified Groundwater • No site-related COCs identified	Historical surface runoff to drainage ditches that flow toward Spring Creek. Groundwater contamination is not present at the site and therefore, would not impact the creek.	1,300 feet	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek.
Ammunition Box Chipper Disposal Pit (ABCDP) IAAP-031 and IAAP-031G	The ABCDP is an inactive site located in the northeastern portion of the IAAAP and encompasses the location of a former disposal pit for ammunition boxes. The boundaries of the disposal pit, reportedly measuring 120 by 40 by 8 feet deep, are from IAAAP personnel hand drawings and IAAAP field reconnaissance activities. The ABCDP was used for a 3-month period sometime in the 3-year period between 1972 and 1975 to dispose of shredded wooden ammunition boxes, primarily 90-mm cartridge boxes, which potentially contained small amounts of explosives. No indication of wooden boxes has been found; thus the location of the disposal pit has not been identified. It is possible that no pit was dug and that the remains of the boxes were deposited on the surface, or that the wood fragments have degraded and resemble soil.	The ABCDP has a slight slope to the south. Overland surface drainage at the site is toward a south trending ditch located in the western portion of the site that flows into an intermittent tributary of Spring Creek. The intermittent tributary. Groundwater flow directions vary from the south-southwest to the east-southeast. There are no perennial surface water habitats within the site.	OU-7	Soil and Groundwater • No perennial surface water features are present onsite.	Soil • Aluminum • Arsenic • Chromium • Cobalt • Iron • Manganese • Vanadium Groundwater • Aluminum • Chromium • Cobalt • Iron • Manganese • Mercury	Historical surface runoff to drainage ditches that flow toward Spring Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	3,400 feet	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek.

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
West Burn Pads Area (WBPA) IAAP-032G	The WBPA composes a generally inactive site located in the northeast portion of the IAAAP facility that covers approximately 14 acres. The WBPA includes the former burn cages, the burn cages landfill, the WBPs, and the WBPs landfill. The WBPA was active between 1947 and 1982, with operations that included open burning demilitarization activities, and burning and disposal of dunnage. Open burning was performed on a variety of munitions debris and related materials including explosive-contaminated metals parts and inert and explosives-contaminated packaging. The Burn Cages and Burn Cage Ash Landfill operated from 1949 to 1982. The Burn Cages were used to incinerate inert and explosives-contaminated packaging, and the Burn Cage Ash Landfill was used to dispose of the residual ash and residue by placing it on the ground and covering it with soil. The WBPA munition response sites operated between 1949 and 1982 to flash explosives-contaminated metal parts and store salvageable metal parts. The site was cleared of metal parts in 1997. The WBPs Landfill operated between 1950 and 1975 and received residue and waste from the WBPs and the EBPs in addition to paper, wood, and metal cans. As with the Burn Cage Ash Landfill, waste material at the WBPs Landfill was placed on the ground surface and covered with soil. The WBPs reportedly contained two trenches used for approximately 1 year in the 1940s or 1950s for flashing of metals contaminated with explosives. The Atomic Energy Commission conducted activities at the WBPA between 1947 and 1975. In 1975, control of the area reverted to the IAAAP. Operations at the WBPA ceased after the Explosive Waste Incinerator was constructed in 1982.	The WBPA is largely vegetated. The topography of the WBPA site slopes eastward towards Spring Creek and northward toward an unnamed tributary of Spring Creek that defines the northern boundary of the site. In the northeast portion of the WBPA, surface runoff follows topography and flows generally toward Spring Creek and the unnamed tributary along the northern boundary of the WBPA. In the southern portion of the site, surface water is channeled into ditches along the road between the former burn pads and WBPs and discharges to Spring Creek. Shallow overburden groundwater flows easterly towards Spring Creek. Bedrock groundwater flow has been generally towards the east and southeast. The portion of Spring Creek in the site provides high quality habitat, however the habitat is only a small area.	OU-10	Groundwater, Surface Water, and Sediment • Soil is addressed under OU-1 ROD. • MEC and MC are addressed under OU-5 ROD.	Groundwater • Freon 113 • 1,1-Dichloroethane • 1,1-Dichloroethene • 1,3-Dinitrobenzene • 2,6-Dinitrotoluene • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • Arsenic • Barium • Benzene • Bromomethane • Chloroform • cis-1,2-Dichloroethene • Dichlorodifluoromethane • Ethylbenzene • HMX • Naphthalene • RDX • TCE Surface Water • No COPCs identified Sediment • Copper • Silver	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination extends immediately adjacent to Spring Creek and to intermittent tributaries that flow into Spring Creek. There is the potential for groundwater discharge to Spring Creek and intermittently into the unnamed tributary.	0 feet A small portion of Spring Creek passes through the eastern side of the WBPA. A perennial unnamed tributary is present in the northern portion of the site, and a breached constructed sedimentation dam is present near the convergence of this tributary with Spring Creek.	Surface water and sediment samples collected along Spring Creek, upstream, downstream, and within the WBPA site boundary (Figure 4-7) Surface water and sediment samples collected from the unnamed tributary that flows within the northern portion of the WBPA (Figure 4-7).

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
North Burn Pads (NBPs) IAAP-036G	The NBPs are an inactive site located in the northeast portion of the IAAAP facility that covers approximately 4 acres. The NBPs consisted of two former earthen burn pads, which were active between 1968 and 1972 for open burning of lead azide and gun powder. A former 275-gallon diesel-refueling station was also present at the base of one of the burn pads, Pad 2-N. There are no remaining structures onsite.	The topography at the NBPs slopes to the south towards a tributary of Spring Creek. Surface runoff near the NBPs discharges into a tributary of Spring Creek south of Pad 2-N. This perennial tributary flows east through the WBPA toward Spring Creek. Shallow overburden groundwater flows to the southeast towards Spring Creek and the tributary to Spring Creek. The portion of Spring Creek in the site provides high quality habitat, however the habitat is only a small area.	OU-10	Groundwater • Soil is addressed under OU-1 ROD. • Surface water and sediment are evaluated under the West Burn Pads Area.	Groundwater • Freon 113 • Chromium	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination does not extend to Spring Creek. Therefore, even though there is the potential for groundwater discharge to surface water along Spring Creek, groundwater contamination should not impact creek.	0 feet A small reach of an unnamed perennial tributary of Spring Creek flows inside the southwestern boundary of the NBP into the WBPA.	Surface water and sediment samples collected from the unnamed tributary that flows within the southwestern portion of the NBPs (Figure 4-7).
North Burn Pads Landfill (NBPLF) IAAP-037G	The NBPLF is located approximately 800 feet north of the NBPs and consists of a former landfill measuring 60 by 470 feet that was capped with clay during RCRA closure in 1980. Residual ash and flashed cans, containers, and construction debris from the NBPs and Explosive Disposal Area were disposed at the NBPLF. Additional activities at this site include waste disposal of waste slightly contaminated with explosives and RCRA 90-day hazardous waste storage of paint filters, which are shipped offsite for disposal. The site is no longer an active landfill and is currently used for temporary waste storage, including of slightly contaminated explosives waste, which is placed in dumpsters and shipped offsite for disposal at approved facilities.	The western portion of the site contains an asphalt parking lot on the south side of Building BG-199-4, while the eastern portion of the side is vegetated. The topography at the NBPLF slopes to the east and north towards Spring Creek. Surface drainage near the NBPLF is through intermittent tributaries that channel surface water flow eastward into Spring Creek. Shallow overburden groundwater at the NBPLF is assumed to flow towards Spring Creek, primarily in east and southeast directions. There are no perennial surface water habitats within the site.	OU-10	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • RDX • Antimony • Cadmium • Chromium	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination extends close to intermittent tributaries outside of the site boundary and could potentially discharge to surface water.	240 feet	Surface water and sediment samples collected from Spring Creek to the east (downstream) of site (Figure 4-7).

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Fire Training Pit (FTP) IAAP-039G	The FTP area includes the former training pit and adjacent areas and facilities to the east and southeast. While the FTP encompasses just under 2 acres, several buildings, including BG-12 and BGs-2 through 5 that are associated with the FTP increase this site's footprint to over 10 acres. The FTA is composed buildings, two former burn pits, and a former disposal pit. The FTP area was used between 1970 and 1988 for firefighting training operations that consisted of placing solvents or fuels in 55-gallon drums within the FTP, igniting the solvents, and then extinguishing the fire using fire suppression foam. The main FTP consisted of an unlined, open depression which measured approximately 40 feet wide, 16 feet long, and 2 feet deep. Two smaller pits existed to the north of the main FTP. One pit located to the northwest of the FTP contained trash and debris, and another pit located to the northeast of the FTP was used as a disposal pit to burn wastes similar to those used in the firefighting practices in the main pit, though this northeast disposal pit was not used for firefighter training. The FTP was identified as an area of potential interest during a Preliminary Assessment for per- and polyfluoroalkyl substances at IAAAP (Arcadis 2020).	The terrain of this site gently slopes to the south and southeast. The eastern portions of the site slope toward an intermittent tributary of Spring Creek, located southeast of the FTP. Surface runoff is channeled through ditches and culverts along the roads at the site, which direct water south and east toward an intermittent tributary of Spring Creek (Figure 5.1-1). Shallow overburden groundwater flows semi-radially towards Spring Creek (to the northeast and east) and an intermittent tributary to Spring Creek (to the southeast). Bedrock groundwater flow is to the east. There are no perennial surface water habitats within the site.	OU-10	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	Groundwater • 2-Amino-4,6-DNT • 4-Amino-2,6-DNT • RDX • Arsenic • Barium • Naphthalene • 1,1,1-Trichloroethane • 1,1,2-Trichloroethane • 1,1-Dichloroethane • 1,1-Dichloroethene • 1,2,4-Trimethylbenzene • 1,2-Dichloroethane • 1,3,5-Trimethylbenzene • Acetone • Benzene • Chloroform • cis-1,2-Dichloroethene • Ethylbenzene • Methyl ethyl ketone • Methyl isobutyl ketone • Methylene chloride • Tetrachloroethene • Toluene • Trichloroethene • Vinyl chloride • Xylene, m,p • Xylene, o	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination extends to intermittent tributaries outside of the FTP site boundary and could potentially discharge to surface water.	1,000 feet	Surface water and sediment samples collected from Spring within the WBPA and downstream of the WBPA (Figure 4-7). These samples would also assess potential impacts from the FTP area.

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Roundhouse Transformer Storage Area Groundwater (Roundhouse) IAAP-040G	The Roundhouse area is in the northeast central portion of the IAAAP facility, approximately 1,000 feet from the north site boundary. The site is approximately 4.5 acres. Prior to 1980, the Roundhouse was used for storing all unused transformers for the IAAAP. No transformers are currently stored at the Roundhouse site.	The Roundhouse area encompasses a graded, flat storage area covered in 6 inches of gravel overlying compacted clay, which was constructed to restrict vertical migration. Runoff from parts of the storage area flows to the sewer system and is treated by the wastewater treatment plant. The remaining runoff flows into drainage ditches east of the site or into agriculture fields south and west of the pad. Surface water in intermittent tributaries, which are located outside of the Roundhouse boundary, eventually flows into Spring Creek. Groundwater was not encountered during previous investigations. There are no perennial surface water habitats within the site.	OU-11	Groundwater • Soil is addressed under OU-1 ROD. • No perennial surface water features are present onsite.	The final RI for OU-11 concluded that there is no basis for a contaminant release to groundwater.	Historical surface runoff to intermittent streams that join Spring Creek. Groundwater contamination is not present at the site and therefore, would not impact the creek.	5,700 feet	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek.
Yard C	Yard C encompasses approximately 301 acres in the eastern portion of the IAAAP and is located east of Line 2. The yard is primarily an open field containing 43 storage igloos and several other support buildings. The yard is surrounded by a security fence. The igloos and their associated loading docks can be accessed from an adjacent rail line or access road. Yard C was constructed in 1941 and 1942 to serve as a storage yard. In 1947, Yard C came under control of the Army Environmental Command which utilized it for the storage of raw explosive materials and sealed radiological components that were placed into warheads. The Army Environmental Command discontinued use of Yard C in 1975. Yard C is currently being used for hay production under the IAAAP leasing program.	Yard C is located within two watersheds, the Brush Creek Watershed and the Spring Creek Watershed. Surface water runoff from the eastern part of Yard C ultimately drains into the Spring Creek Watershed. Brush Creek drains the far western portion of Yard C. The rail lines located adjacent to each row of bunkers are ditched for water drainage. Some runoff discharges to a small pond located near the eastern fence line of Yard C. Groundwater flow in the shallow aquifer is toward the southeast. Groundwater flow in the upper bedrock aquifer is generally toward the south. The only perennial surface water features withing the site are two retention ponds surrounded by landscaped field, providing low quality habitat.	OU-7	Groundwater and Surface Water • Soil and sediment are addressed under the FUSRAP ROD.	Groundwater • Barium • Surface Water • No COPCs identified	Historical surface runoff to drainage ditches that flow toward Spring Creek. Groundwater contamination is defined within site boundary and will not discharge to the creek.	1,800 feet to Spring Creek 1,800 feet to Brush Creek	No surface water and sediment samples from Spring Creek to assess this site since other IAAAP sites are closer than 1,000 feet to Spring Creek. Surface water and sediment samples collected from Brush Creek to southwest (downstream) of the site (Figure 4-5). Surface water samples collected from small pond within site boundary; since this surface water feature does not interact with the creek, it is evaluated with the site under the OU-7 RI.

Table 1-4. Summary of RI Sites within the Spring Creek Watershed

Iowa Army Ammunition Plant, Middletown, Iowa

IAAAP Area (Abbreviation) AEDB Site Number(s)	IAAAP Site Description and Operational History	Environmental Setting	RI Summary					
			RI Report Operable Unit[a]	Media Addressed Under RI	Chemicals of Potential Concern (COPCs) Identified in RI Report[b]	Potential Migration Pathway(s) to Creek	Approximate Distance to Spring Creek	Surface Water/Sediment Samples Collected to Assess Potential Impacts to Creek
Maneuver Area (MA) IAAP-006-R-02	The MA encompasses approximately 486 acres in the southeastern portion of the IAAAP between Spring Creek and the eastern boundary of the IAAAP facility. Starting in approximately 1969, the MA was used for training exercises by the Iowa Air National Guard; however, the MA has not been used for live fire training since September 2001. During training exercises, ammunition blanks and pyrotechnics may have been used.	The MA is vegetated with trees, tall grass, and shrubs and is mostly undeveloped. The topography is hilly, with areas occupied by streams, flood plains, and flat fields. Facility-wide groundwater levels suggest that the overall flow direction in the bedrock is to the south and west towards Spring Creek when not intercepted by incised surface drainages. The portion of Spring Creek in the site provides high quality habitat.	OU-11	Groundwater • MEC and MC are addressed under OU-5 ROD.	The final RI for OU-11 concluded that there is no basis for a contaminant release at the MA.	Contamination is not present at the site and therefore, would not impact the creek.	0 feet Spring Creek is along the western boundary of the site.	Surface water and sediment samples collected from Spring Creek along the eastern site boundary and downstream of the MA (Figure 4-8).

[a] RI is ongoing or was recently completed for OU-4, OU-6, OU-7, OU-9, OU-10, and OU-12. The following OUs have a ROD in place are no longer under RI: OU-1, OU-3, OU-5, and OU-8. The RI report for OU-4 (Leidos and Jacobs 2022), the RI Addendum for OU-9 (Leidos 2020), the RI report for OU-11 (CH2M 2021a), and the Phase 1 RI Report for OU-12 (CH2M 2021b) have been finalized. The RI reports for OU-6, OU-7, and OU-10 are under the internal draft phase. The Phase 2 RI report for OU-12 will be completed in the future. The OU under which each IRP will be addressed after the RI may change.

[b] The COPCs listed for sites included in the internal draft RI reports for OU-6, OU-7, and OU-10, and in the final Phase I RI report for OU-12 and may change.

NA = Not analyzed
µg/kg = micrograms per Kilogram
J = The analyte was positively identified: the associated numerical value is the approximate concentration of the analyte in the sample.
mg/kg = milligrams per Kilogram
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
UJ = The analyte was below the reported sample quantitation limit. However, the reported value is approximate.
Shading indicates detected result

Station ID		BC-TTSD-030	BC-TTSD-031	BC-TTSD-032
Sample ID		BC-TTSD-030	BC-TTSD-031	BC-TTSD-032
Sample Date		03/23/06	03/23/06	03/23/06
Chemical Name				
bis(2-ethylhexyl)phthalate		NA	NA	NA
Butylbenzylphthalate		NA	NA	NA
Carbazole		NA	NA	NA
Di-n-butyl phthalate		NA	NA	NA
Di-n-octyl phthalate		NA	NA	NA
Dibenzofuran		NA	NA	NA
Dibenzothiophene		NA	NA	NA
Diethyl phthalate		NA	NA	NA
Dimethyl phthalate		NA	NA	NA
Hexachlorobenzene		NA	NA	NA
Hexachlorobutadiene		NA	NA	NA
Hexachlorocyclopentadiene		NA	NA	NA
Hexachloroethane		NA	NA	NA
Isophorone		NA	NA	NA
n-Nitroso-di-n-propylamine		NA	NA	NA
N-Nitrosodimethylamine		NA	NA	NA
N-nitrosodiphenylamine		NA	NA	NA
Pentachlorophenol		NA	NA	NA
Phenol		NA	NA	NA
Total Dichlorobenzenes		NA	NA	NA
1-Methyl naphthalene		NA	NA	NA
2-Methyl naphthalene		NA	NA	NA
Acenaphthene		NA	NA	NA
Acenaphthylene		NA	NA	NA
Anthracene		NA	NA	NA
Benzo(a)anthracene		NA	NA	NA
Benzo(a)pyrene		NA	NA	NA
Benzo(b)fluoranthene		NA	NA	NA
Benzo(ghi)perylene		NA	NA	NA
Benzo(k)fluoranthene		NA	NA	NA
Chrysene		NA	NA	NA
Dibenzo(a,h)anthracene		NA	NA	NA
Fluoranthene		NA	NA	NA
Fluorene		NA	NA	NA
Indeno(1,2,3-cd)pyrene		NA	NA	NA
naphthalene		NA	NA	NA
Phenanthrene		NA	NA	NA
Pyrene		NA	NA	NA
Explosives (µg/kg)				
1,3,5-Trinitrobenzene	U	250 U	250 U	250 U
1,3-Dinitrobenzene	U	250 U	250 U	250 U
2,4,6-Trinitrotoluene		735	825	155 J
2,4-Dinitrotoluene	U	250 U	250 U	250 U
2,6-Dinitrotoluene	U	250 U	250 U	250 U

Sample ID		BC-TTSD-030	BC-TTSD-031	BC-TTSD-032
Sample Date		03/23/06	03/23/06	03/23/06
Chemical Name				
2-Amino-4,6-dinitrotoluene		554	713	130 J
2-Nitrotoluene	U	250 U	250 U	250 U
3-Nitrotoluene	U	250 U	250 U	250 U
4-Amino-2,6-dinitrotoluene		392	513	102 J
4-Nitrotoluene	U	250 U	250 U	250 U
HMX		3,410	1,110	250 U
Nitrobenzene	U	250 U	250 U	250 U
RDX		5,920	3,030	582
Tetryl	U	250 U	250 U	250 U
Volatile Organic Compounds (µg/kg)				
1,1,1-Trichloroethane		NA	NA	NA
1,1,2,2-Tetrachloroethane		NA	NA	NA
1,1,2-Trichloroethane		NA	NA	NA
1,1-Dichloroethane		NA	NA	NA
1,1-Dichloroethene		NA	NA	NA
1,2,3-Trichlorobenzene		NA	NA	NA
1,2,3-Trichloropropane		NA	NA	NA
1,2,4-Trimethylbenzene		NA	NA	NA
1,2-Dibromo-3-chloropropane		NA	NA	NA
1,2-Dibromoethane		NA	NA	NA
1,2-Dichloroethane		NA	NA	NA
1,2-Dichloroethene (total)		NA	NA	NA
1,2-Dichloropropane		NA	NA	NA
2,6,10,14-Tetramethylpentadecane		NA	NA	NA
2-Chloroethyl vinyl ether		NA	NA	NA
2-Hexanone		NA	NA	NA
Acetone		NA	NA	NA
Acrolein		NA	NA	NA
Acrylonitrile		NA	NA	NA
Benzene		NA	NA	NA
Bromodichloromethane		NA	NA	NA
Bromoform		NA	NA	NA
Bromomethane		NA	NA	NA
Carbon disulfide		NA	NA	NA
Carbon tetrachloride		NA	NA	NA
Chloro methane		NA	NA	NA
Chlorobenzene		NA	NA	NA
Chloroethane		NA	NA	NA
Chloroform		NA	NA	NA
cis-1,2-Dichloroethene		NA	NA	NA
cis-1,3-Dichloropropene		NA	NA	NA
Dibromochloromethane		NA	NA	NA
Dichlorodifluoromethane		NA	NA	NA
Ethyl- benzene		NA	NA	NA

Sample ID	W-9-19810628-SD
Sample Date	06/28/81
Chemical Name	
bis(2-ethylhexyl)phthalate	NA
Butylbenzylphthalate	NA
Carbazole	NA
Di-n-butyl phthalate	NA
Di-n-octyl phthalate	NA
Dibenzofuran	NA
Dibenzothiophene	NA
Diethyl phthalate	NA
Dimethyl phthalate	NA
Hexachlorobenzene	NA
Hexachlorobutadiene	NA
Hexachlorocyclopentadiene	NA
Hexachloroethane	NA
Isophorone	NA
n-Nitroso-di-n-propylamine	NA
N-Nitrosodimethylamine	NA
N-nitrosodiphenylamine	NA
Pentachlorophenol	NA
Phenol	NA
Total Dichlorobenzenes	NA
1-Methyl naphthalene	NA
2-Methyl naphthalene	NA
Acenaphthene	NA
Acenaphthylene	NA
Anthracene	NA
Benzo(a)anthracene	NA
Benzo(a)pyrene	NA
Benzo(b)fluoranthene	NA
Benzo(ghi)perylene	NA
Benzo(k)fluoranthene	NA
Chrysene	NA
Dibenzo(a,h)anthracene	NA
Fluoranthene	NA
Fluorene	NA
Indeno(1,2,3-cd)pyrene	NA
naphthalene	NA
Phenanthrene	NA
Pyrene	NA
Explosives (µg/kg)	
1,3,5-Trinitrobenzene	NA
1,3-Dinitrobenzene	NA
2,4,6-Trinitrotoluene	NA
2,4-Dinitrotoluene	NA
2,6-Dinitrotoluene	NA

Table 4-3. Brush Creek Sediment Analytical Data

Watershed Ecological Risk Assessment

Iowa Army Ammunition Plant Site

Station ID	I-9
Sample ID	W-9-19810628-SD
Sample Date	06/28/81
Chemical Name	
2-Amino-4,6-dinitrotoluene	NA
2-Nitrotoluene	NA
3-Nitrotoluene	NA
4-Amino-2,6-dinitrotoluene	NA
4-Nitrotoluene	NA
HMX	NA
Nitrobenzene	NA
RDX	NA
Tetryl	NA
Volatile Organic Compounds (µg/kg)	
1,1,1-Trichloroethane	NA
1,1,2,2-Tetrachloroethane	NA
1,1,2-Trichloroethane	NA
1,1-Dichloroethane	NA
1,1-Dichloroethene	NA
1,2,3-Trichlorobenzene	NA
1,2,3-Trichloropropane	NA
1,2,4-Trimethylbenzene	NA
1,2-Dibromo-3-chloropropane	NA
1,2-Dibromoethane	NA
1,2-Dichloroethane	NA
1,2-Dichloroethene (total)	NA
1,2-Dichloropropane	NA
2,6,10,14-Tetramethylpentadecane	NA
2-Chloroethyl vinyl ether	NA
2-Hexanone	NA
Acetone	NA
Acrolein	NA
Acrylonitrile	NA
Benzene	NA
Bromodichloromethane	NA
Bromoform	NA
Bromomethane	NA
Carbon disulfide	NA
Carbon tetrachloride	NA
Chloro methane	NA
Chlorobenzene	NA
Chloroethane	NA
Chloroform	NA
cis-1,2-Dichloroethene	NA
cis-1,3-Dichloropropene	NA
Dibromochloromethane	NA
Dichlorodifluoromethane	NA
Ethyl- benzene	NA

Table 4-3. Brush Creek Sediment Analytical Data

Watershed Ecological Risk Assessment

Iowa Army Ammunition Plant Site

Station ID	I-9
Sample ID	W-9-19810628-SD
Sample Date	06/28/81
Chemical Name	
Isopropylbenzene	NA
Methyl ethyl ketone	NA
Methyl isobutyl ketone	NA
Methyl tert-butyl ether (MTBE)	NA
Methylene chloride	NA
N-Butylbenzene	NA
N-Propylbenzene	NA
Styrene	NA
Tetrachloroethene	NA
Toluene	NA
trans-1,2-Dichloroethene	NA
trans-1,3-Dichloropropene	NA
Trichloroethene	NA
Trichlorofluoromethane (Freon 11)	NA
Vinyl acetate	NA
Vinyl chloride	NA
Xylene, o-	NA
Xylenes, total	NA

µg/kg = microgram per kilogram

mg/kg = milligram per kilogram

J - Estimated

NA - Not analyzed

U - Undetected

UJ - Undetected, estimated limit

Shading indicates detected result
